(Based on slides by Dan Suciu)

---

---

---

---

---

---

---

---

## Announcements

- Brief web service HW discussion on Friday
- More detailed requirements for midterm demos and design document will be out soon
  - Just a longer version of what I announced in class last week

CS/INFO 330

2

---

---

---

---

---

---

---

---

## Recall: XPath

<code>bib</code>	matches a <code>bib</code> element
<code>*</code>	matches any element
<code>/</code>	matches the <code>root</code> element
<code>/bib</code>	matches a <code>bib</code> element under <code>root</code>
<code>bib/paper</code>	matches a <code>paper</code> in <code>bib</code>
<code>bib//paper</code>	matches a <code>paper</code> in <code>bib</code> , at any depth
<code>//paper</code>	matches a <code>paper</code> at any depth
<code>paper book</code>	matches a <code>paper</code> or a <code>book</code>
<code>@price</code>	matches a <code>price</code> attribute
<code>bib/book/@price</code>	matches <code>price</code> attribute in <code>book</code> , in <code>bib</code>
<code>bib/book[@price&lt;"55"]/author/lastname</code>	matches...

CS/INFO 330

3

---

---

---

---

---

---

---

---

## XQuery

- Based on Quilt, which is based on XML-QL
- Uses XPath to express more complex queries

CS/INFO 330

4

---

---

---

---

---

---

---

---

## FLWR (“Flower”) Expressions

```
FOR ...  
LET...  
WHERE...  
RETURN...
```

CS/INFO 330

5

---

---

---

---

---

---

---

---

## Sample Data for Queries (More or Less)

```
<bib>  
  <book> <publisher> Addison-Wesley </publisher>  
    <author> Serge Abiteboul </author>  
    <author> <first-name> Rick </first-name>  
      <last-name> Hull </last-name>  
    </author>  
    <author> Victor Vianu </author>  
    <title> Foundations of Databases </title>  
    <year> 1995 </year>  
  </book>  
  <book price="55">  
    <publisher> Freeman </publisher>  
    <author> Jeffrey D. Ullman </author>  
    <title> Principles of Database and Knowledge Base Systems  
  </title>  
    <year> 1998 </year>  
  </book>  
</bib>
```

CS/INFO 330

6

---

---

---

---

---

---

---

---

## FOR-WHERE-RETURN

Find all book titles published after 1995:

```
FOR $x IN document("bib.xml")/bib/book
WHERE $x/year/text() > 1995
RETURN $x/title
```

Result (abstracted version):

```
<title> abc </title>
<title> def </title>
<title> ghi </title>
```

CS/INFO 330

7

---

---

---

---

---

---

---

---

## FOR-WHERE-RETURN

Equivalently (perhaps more geek-ish)

```
FOR $x IN document("bib.xml")/bib/book[year/text() > 1995] /title
RETURN $x
```

And even shorter:

```
document("bib.xml")/bib/book[year/text() > 1995] /title
```

CS/INFO 330

8

---

---

---

---

---

---

---

---

## FOR-WHERE-RETURN

- Find all book titles and the year when they were published:

```
FOR $x IN document("bib.xml")/bib/book
RETURN <answer>
  <what>{ $x/title/text() } </what>
  <when>{ $x/year/text() } </when>
</answer>
```

We can construct whatever XML results we want !

CS/INFO 330

9

---

---

---

---

---

---

---

---

## Answer

```
<answer>
  <what> How to cook a Turkey </what>
  <when> 2003 </when>
</answer>
<answer>
  <what> Cooking While Watching TV </what>
  <when> 2004 </when>
</answer>
<answer>
  <what> Turkeys on TV</what>
  <when> 2002 </when>
</answer>
...
```

CS/INFO 330

10

---

---

---

---

---

---

---

---

## FOR-WHERE-RETURN

- Notice the use of “{“ and “}” in previous example
- What is the result without them?

```
FOR $x IN document("bib.xml")/bib/book
RETURN <answer>
  <title> $x/title/text() </title>
  <year> $x/year/text() </year>
</answer>
```

CS/INFO 330

11

---

---

---

---

---

---

---

---

## XQuery: Nesting

For each author of a book by Morgan Kaufmann,  
list all books she published:

```
FOR $b IN document("bib.xml")/bib,
  $a IN $b/book[publisher/text()='Morgan Kaufmann']/author
RETURN <result>
  { $a,
    FOR $t IN $b/book[author/text()=$a/text()]/title
    RETURN $t
  }
</result>
```

In the **RETURN** clause comma concatenates XML fragments

CS/INFO 330

12

---

---

---

---

---

---

---

---

## XQuery

Result:

```
<result>
  <author>Jones</author>
  <title> abc </title>
  <title> def </title>
</result>
<result>
  <author> Smith </author>
  <title> ghi </title>
</result>
```

CS/INFO 330

13

---

---

---

---

---

---

---

---

## Aggregates

Find all books with more than 3 authors:

```
FOR $x IN document("bib.xml")/bib/book
WHERE count($x/author) > 3
RETURN $x
```

**count** = a function that counts  
**avg** = computes the average  
**sum** = computes the sum  
**distinct-values** = eliminates duplicates

CS/INFO 330

14

---

---

---

---

---

---

---

---

## Aggregates

Same thing:

```
FOR $x IN document("bib.xml")/bib/book[count(author) > 3]
RETURN $x
```

CS/INFO 330

15

---

---

---

---

---

---

---

---

## Aggregates

Print all authors who published more than 3 books

```
FOR $b IN document("bib.xml")/bib,  
  $a IN $b/book/author/text()  
WHERE count($b/book[author/text()=$a]) > 3  
RETURN <author> { $a } </author>
```

What's wrong ?

CS/INFO 330

16

---

---

---

---

---

---

---

---

## Aggregates

Be aware of duplicates !

```
FOR $b IN document("bib.xml")/bib,  
  $a IN distinct-values($b/book/author/text())  
WHERE count($b/book[author/text()=$a]) > 3  
RETURN <author> { $a } </author>
```

CS/INFO 330

17

---

---

---

---

---

---

---

---

## XQuery

Find books whose price is larger than average:

```
FOR $b in document("bib.xml")/bib  
LET $a:=avg($b/book/price/text())  
FOR $x in $b/book  
WHERE $x/price/text() > $a  
RETURN $x
```

LET binds a variable to one value;  
FOR iterates a variable over a list of values  
**We will come back to that**

CS/INFO 330

18

---

---

---

---

---

---

---

---

## FOR-WHERE-RETURN

- “Flatten” the authors, i.e. return a list of (author, title) pairs

```
FOR $b IN document("bib.xml")/bib/book,  
  $x IN $b/title/text(),  
  $y IN $b/author/text()  
RETURN <answer>  
  <title> { $x } </title>  
  <author> { $y } </author>  
</answer>
```

```
Answer:  
<answer>  
  <title> abc </title>  
  <author> efg </author>  
</answer>  
<answer>  
  <title> abc </title>  
  <author> hkj </author>  
</answer>
```

CS/INFO 330

19

---

---

---

---

---

---

---

---

## FOR-WHERE-RETURN

- For each author, return all book titles he/she wrote

```
FOR $b IN document("bib.xml")/bib,  
  $x IN $b/book/author/text()  
RETURN  
<answer>  
  <author> { $x } </author>  
  { FOR $y IN $b/book[author/text()=$x]/title  
    RETURN $y }  
</answer>
```

```
Answer:  
<answer>  
  <author> efg </author>  
  <title> abc </title>  
  <title> klm </title>  
  . . . .  
</answer>
```

What about  
duplicate  
authors ?

CS/INFO 330

20

---

---

---

---

---

---

---

---

## FOR-WHERE-RETURN

- Same, but eliminate duplicate authors:

```
FOR $b IN document("bib.xml")/bib  
LET $a := distinct-values($b/book/author/text())  
FOR $x IN $a  
RETURN  
<answer>  
  <author> $x </author>  
  { FOR $y IN $b/book[author/text()=$x]/title  
    RETURN $y }  
</answer>
```

CS/INFO 330

21

---

---

---

---

---

---

---

---

## FOR-WHERE-RETURN

- Same thing:

```
FOR $b IN document("bib.xml")/bib,
  $x IN distinct-values($b/book/author/text())
RETURN
<answer>
  <author> $x </author>
  { FOR $y IN $b/book[author/text()=$x]/title
    RETURN $y }
</answer>
```

CS/INFO 330

22

---

---

---

---

---

---

---

---

## SQL and XQuery Side-by-side

Product(pid, name, maker, price)

Find all product names, prices,  
sort by price

```
SELECT x.name,
       x.price
FROM Product x
ORDER BY x.price
```

SQL

```
FOR $x in document("db.xml")/db/Product/row
ORDER BY $x/price/text()
RETURN <answer>
  { $x/name, $x/price }
</answer>
```

XQuery

CS/INFO 330

23

---

---

---

---

---

---

---

---

## Answers

Name	Price
abc	7
def	23
...	...

```
<answer>
  <name> abc </name>
  <price> 7 </price>
</answer>
<answer>
  <name> def </name>
  <price> 23 </price>
</answer>
...
```

Notice: this is NOT a  
well-formed document !  
(WHY ???)

CS/INFO 330

24

---

---

---

---

---

---

---

---

## Producing a Well-Formed Answer

```

<myQuery>
{ FOR $x in document("db.xml")/db/Product/row
  ORDER BY $x/price/text()
  RETURN <answer>
    { $x/name, $x/price }
    </answer>
}
</myQuery>

```

CS/INFO 330

25

---

---

---

---

---

---

---

---

## XQuery's Answer

```

<myQuery>
<answer>
  <name> abc </name>
  <price> 7 </price>
</answer>
<answer>
  <name> def </name>
  <price> 23 </price>
</answer>
...
</myQuery>

```

Now it is well-formed !

CS/INFO 330

26

---

---

---

---

---

---

---

---

## SQL and XQuery Side-by-side

Product(pid, name, maker, price)

Company(cid, name, city, revenues)

Find all products made in Ithaca

```

SELECT x.name
FROM Product x, Company y
WHERE x.maker=y.cid
      and y.city="Ithaca"

```

SQL

```

FOR $r in document("db.xml")/db,
  $x in $r/Product/row,
  $y in $r/Company/row
WHERE
  $x/maker/text()=$y/cid/text()
  and $y/city/text() = "Ithaca"
RETURN { $x/name }

```

XQuery

Cool  
XQuery

```

FOR $y in /db/Company/row[city/text()='Ithaca'],
  $x in /db/Product/row[maker/text()=$y/cid/text()]
RETURN { $x/name }

```

---

---

---

---

---

---

---

---

## Result

```
<product>
  <row> <pid> 123 </pid>
    <name> abc </name>
    <maker> efg </maker>
  </row>
  <row> ... </row>
  ...
</product>
<product>
  ...
</product>
...
```

CS/INFO 330

28

---

---

---

---

---

---

---

---

---

---

## SQL and XQuery Side-by-side

For each company with revenues < 1M count the products over \$100

```
SELECT y.name, count(*)
FROM Product x, Company y
WHERE x.price > 100 and x.maker=y.cid and y.revenue < 1000000
GROUP BY y.cid, y.name
```

```
FOR $r in document("db.xml")/db,
  $y in $r/Company/row[revenue/text()<1000000]
RETURN
  <proudCompany>
    <companyName> { $y/name/text() } </companyName>
    <numberOfExpensiveProducts>
      { count($r/Product/row[maker/text()=$y/cid/text()][price/text()>100]) }
    </numberOfExpensiveProducts>
  </proudCompany>
```

---

---

---

---

---

---

---

---

---

---

## SQL and XQuery Side-by-side

Find companies with at least 30 products, and their average price

```
SELECT y.name, avg(x.price)
FROM Product x, Company y
WHERE x.maker=y.cid
GROUP BY y.cid, y.name
HAVING count(*) > 30
```

```
FOR $r in document("db.xml")/db,
  $y in $r/Company/row
LET $p := $r/Product/row[maker/text()=$y/cid/text()]
WHERE count($p) > 30
RETURN
  <theCompany>
    <companyName> { $y/name/text() }
    </companyName>
    <avgPrice> avg($p/price/text()) </avgPrice>
  </theCompany>
```

An element

A collection

CS/INFO 330

30

---

---

---

---

---

---

---

---

---

---

## FOR vs. LET

### FOR

- Binds *node variables* → iteration

### LET

- Binds *collection variables* → one value

CS/INFO 330

31

---

---

---

---

---

---

---

---

## FOR vs. LET

```
FOR $x IN /bib/book  
RETURN <result> { $x } </result>
```

Returns:  
<result> <book>...</book></result>  
<result> <book>...</book></result>  
<result> <book>...</book></result>  
...

```
LET $x := /bib/book  
RETURN <result> { $x } </result>
```

Returns:  
<result> <book>...</book>  
<book>...</book>  
<book>...</book>  
...  
</result>

CS/INFO 330

32

---

---

---

---

---

---

---

---

## Collections in XQuery

- Ordered and unordered collections
  - `/bib/book/author/text()` = an *ordered* collection: result is in *document order*
  - `distinct-values(/bib/book/author/text())` = an *unordered* collection: the output order is implementation dependent
- `LET $a := /bib/book` → `$a` is a collection
- `$b/author` → a collection (several authors...)

```
RETURN <result> { $b/author } </result>
```

Returns:  
<result> <author>...</author>  
<author>...</author>  
<author>...</author>  
...  
</result>

CS/INFO 330
