

Lecture 6

Specifications & Testing

Announcements For This Lecture

Last Call

- Acad. Integrity Quiz
- Take it by tomorrow
- Also remember survey

Assignment 1

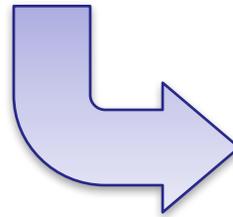

- Posted on web page
 - Due Sun, Sep. 18th
 - Due in place of Lab 4
 - Revise until correct
- Can work in pairs
 - One submission for pair
 - Mixer today at 5:30
 - Meet in Gates Atrium

One-on-One Sessions

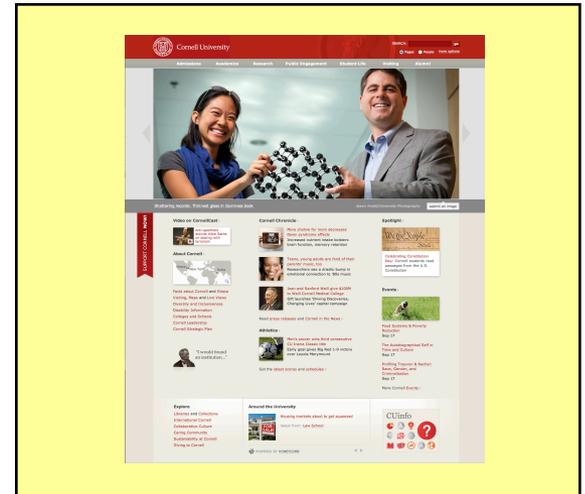

- Starts tomorrow: 1/2-hour one-on-one sessions
 - To help prepare you for the assignment
 - **Primarily for students with little experience**
- There are still some spots available
 - Sign up for a slot in CMS
- Will keep running after **September 19**
 - Will open additional slots after the due date
 - Will help students revise Assignment 1

A1: The Module urllib2

- Module urllib2 is used to read web pages
 - Function urlopen creates a url object
 - `u = urllib2.urlopen('http://www.cornell.edu')`

u

- url has a method called read()
 - Returns contents of web page
 - **Usage:** `s = u.read()` # s is a string

Recall: The Python API

The image shows a screenshot of the Python documentation for the `math` module, specifically the `ceil` function. The page title is "9.2. math — Mathematical functions — Python v2.7.3 documentation". The function signature is `math.ceil(x)`. A callout box points to the function name `ceil`. Another callout box points to the parameter `x`. A third callout box points to the description: "Return the ceiling of `x` as a float, the smallest integer value greater than or equal to `x`." A fourth callout box points to the return value description: "Return the ceiling of `x` as a float, the smallest integer value greater than or equal to `x`." The page also includes a sidebar with navigation links and a search box.

Function name

Number of arguments

`math.ceil(x)`

Return the ceiling of `x` as a float, the smallest integer value greater than or equal to `x`.

What the function evaluates to

Recall: The Python API

The image shows a screenshot of the Python documentation for the `math.ceil(x)` function. The page title is "9.2. math — Mathematical functions". A search bar at the top right contains "python library". The main heading is "9.2. math — Mathematical functions". Below this, the function signature is `math.ceil(x)`. A callout box points to `ceil` with the text "Function name". Another callout box points to `(x)` with the text "Number of arguments". Below the signature, the docstring reads: "Return the ceiling of `x` as a float, the smallest integer value greater than or equal to `x`." A third callout box points to this docstring with the text "What the function evaluates to". The page also includes a sidebar with navigation links like "Table Of Contents", "Next topic", "This Page", and "Quick search". The main content area lists other functions like `math.copysign(x, y)`, `math.fabs(x)`, `math.factorial(x)`, and `math.floor(x)`.

- This is a **specification**
 - Enough info to use func.
 - But not how to implement
- Write them as **docstrings**

Anatomy of a Specification

```
def greet(n):
```

```
    """Prints a greeting to the name n
```

```
    Greeting has format 'Hello <n>!'
```

```
    Followed by conversation starter.
```

```
    Parameter n: person to greet
```

```
    Precondition: n is a string"""
```

```
    print 'Hello '+n+'!'
```

```
    print 'How are you?'
```

One line description,
followed by blank line

Anatomy of a Specification

```
def greet(n):
```

```
    """Prints a greeting to the name n
```

```
    Greeting has format 'Hello <n>!'
    Followed by conversation starter.
```

```
    Parameter n: person to greet
```

```
    Precondition: n is a string"""
```

```
    print 'Hello '+n+'!'
```

```
    print 'How are you?'
```

One line description,
followed by blank line

More detail about the
function. It may be
many paragraphs.

about the arguments

Anatomy of a Specification

```
def to_centrigrade(x):
```

```
    """Returns: x converted to centigrade
```

```
    Value returned has type float.
```

```
    Parameter x: temp in fahrenheit
```

```
    Precondition: x is a float"""
```

```
    return 5*(x-32)/9.0
```

“Returns” indicates a fruitful function

More detail about the function. It may be many paragraphs.

Parameter description

Precondition specifies assumptions we make about the arguments

Preconditions

- Precondition is a **promise**
 - If precondition is true, the function works
 - If precondition is false, no guarantees at all
- Get **software bugs** when
 - Function precondition is not documented properly
 - Function is used in ways that violates precondition

```
>>> to_centiGrade(32.0)
```

```
0.0
```

```
>>> to_centiGrade(212)
```

```
100.0
```

Preconditions

- Precondition is a **promise**
 - If precondition is true, the function works

- Get **software bugs** when
 - Function precondition is not documented properly
 - Function is used in ways that violates precondition

```
>>> to_centigrade(32.0)
```

```
0.0
```

```
>>> to_centigrade(212)
```

```
100.0
```

```
>>> to_centigrade('32')
```

```
Traceback (most recent call last):
```

```
File "<stdin>", line 1, in <module>
```

```
File "temperature.py", line 19 ...
```

```
TypeError: unsupported operand type(s)  
for -: 'str' and 'int'
```

Precondition violated

Test Cases: Finding Errors

- **Bug:** Error in a program. (Always expect them!)
- **Debugging:** Process of finding bugs and removing them.
- **Testing:** Process of analyzing, running program, looking for bugs.
- **Test case:** A set of input values, together with the expected output.

Get in the habit of writing test cases for a function from the function's specification —even *before* writing the function's body.

```
def number_vowels(w):  
    """Returns: number of vowels in word w.  
  
    Precondition: w string w/ at least one letter and only letters"""  
    pass # nothing here yet!
```

Test Cases: Finding Errors

- **Bug:** Error in a program. (Always
- **Debugging:** Process of finding bug
- **Testing:** Process of analyzing, run
- **Test case:** A set of input values, to

Get in the habit of writing test case
function's specification — even *be*

Some Test Cases

- `number_vowels('Bob')`
Answer should be 1
- `number_vowels('Aeiuo')`
Answer should be 5
- `number_vowels('Grrr')`
Answer should be 0

```
def number_vowels(w):
```

```
    """Returns: number of vowels in word w.
```

```
    Precondition: w string w/ at least one letter and only letters"""
```

```
    pass # nothing here yet!
```

Representative Tests

- Cannot test all inputs
 - “Infinite” possibilities
- Limit ourselves to tests that are **representative**
 - Each test is a significantly different input
 - Every possible input is similar to one chosen
- An art, not a science
 - If easy, never have bugs
 - Learn with much practice

Representative Tests for number_vowels(w)

- Word with just one vowel
 - For each possible vowel!
- Word with multiple vowels
 - Of the same vowel
 - Of different vowels
- Word with only vowels
- Word with no vowels

Running Example

- The following function has a bug:

```
def last_name_first(n):  
    """Returns: copy of <n> but in the form <last-name>, <first-name>  
  
    Precondition: <n> is in the form <first-name> <last-name>  
    with one or more blanks between the two names"""  
    end_first = n.find(' ')  
    first = n[:end_first]  
    last = n[end_first+1:]  
    return last+', '+first
```

- Representative Tests:
 - last_name_first('Walker White') give 'White, Walker'
 - last_name_first('Walker White') gives 'White, Walker'

Running Example

- The following function has a bug:

```
def last_name_first(n):  
    """Returns: copy of <n> but in the form <last-name>, <first-name>  
  
    Precondition: <n> is in the form <first-name> <last-name>  
    with one or more blanks between the two names"""  
    end_first = n.find(' ')  
    first = n[:end_first]  
    last = n[end_first+1:]  
    return last+', '+first
```

Look at precondition
when choosing tests

- Representative Tests:
 - last_name_first('Walker White') give 'White, Walker'
 - last_name_first('Walker White') gives 'White, Walker'

Unit Test: A Special Kind of Script

- A unit test is a script that tests another module
 - It **imports the other module** (so it can access it)
 - It **imports the `cornelltest` module** (for testing)
 - It **defines one or more test cases**
 - A representative input
 - The expected output
- The test cases use the `cornelltest` function

```
def assert_equals(expected,received):  
    """Quit program if expected and received differ"""
```

Testing last_name_first(n)

```
import name                # The module we want to test
import cornelltest        # Includes the test procedures

# First test case
result = name.last_name_first('Walker White')
cornelltest.assert_equals('White, Walker', result)

# Second test case
result = name.last_name_first('Walker      White')
cornelltest.assert_equals('White, Walker', result)

print 'Module name is working correctly'
```

Testing last_name_first(n)

```
import name                # The module we want to test
import cornelltest        # Includes the test procedures

# First test case
result = name.last_name_first('Walker White')
cornelltest.assert_equals('White, Walker', result)

# Second test case
result = name.last_name_first('Walker White')
cornelltest.assert_equals('White, Walker', result)

print 'Module name is working correctly'
```

Actual Output

Input

Expected Output

Testing last_name_first(n)

```
import name          # The module we want to test
import cornelltest   # Includes the test procedures
```

```
# First test case
```

```
result = name.last_name_first('Walker White')
cornelltest.assert_equals('White, Walker', result)
```

Quits Python
if not equal

```
# Second test case
```

```
result = name.last_name_first('Walker White')
cornelltest.assert_equals('White, Walker', result)
```

```
print 'Module name is working correctly'
```

Message will print
out only if no errors.

Using Test Procedures

- In the real world, we have a lot of test cases
 - I wrote 10000+ test cases for a C++ game library
 - You need a way to cleanly organize them
- **Idea:** Put test cases inside another procedure
 - Each function tested gets its own procedure
 - Procedure has test cases for that function
 - Also some print statements (to verify tests work)
- Turn tests on/off by calling the test procedure

Test Procedure

```
def test_last_name_first():  
    """Test procedure for last_name_first(n)"""  
    print 'Testing function last_name_first'  
    result = name.last_name_first('Walker White')  
    cornelltest.assert_equals('White, Walker', result)  
    result = name.last_name_first('Walker      White')  
    cornelltest.assert_equals('White, Walker', result)
```

Execution of the testing code

```
test_last_name_first()  
print 'Module name is working correctly'
```

Test Procedure

```
def test_last_name_first():
```

```
    """Test procedure for last_name_first(n)"""
```

```
    print 'Testing function last_name_first'
```

```
    result = name.last_name_first('Walker White')
```

```
    cornelltest.assert_equals('White, Walker', result)
```

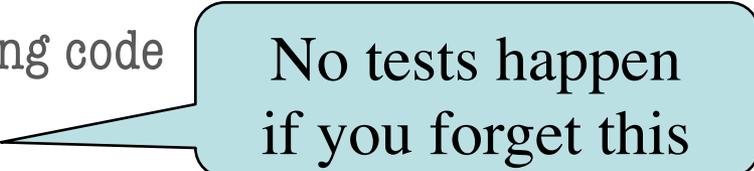

```
    result = name.last_name_first('Walker      White')
```

```
    cornelltest.assert_equals('White, Walker', result)
```

```
# Execution of the testing code
```

```
test_last_name_first()
```

```
print 'Module name is working correctly'
```

No tests happen
if you forget this
