

Lecture 14

# Recursion

# Announcements for Today

---

## Prelim 1

---

- Review session Sunday
  - Time still TBA
  - Announce tomorrow
- Exam Tuesday 7:30 pm
  - **A-C** in Ives 305
  - **D-Z** in Bailey 101
- Graded by Wed night
  - Office hours open on Thur

## Assignments

---

- Assignment 3 still grading
  - Done by tomorrow
  - Survey is still open
  - Only 525 survey responses
- Assignment 4 is now up!
  - Parts 1-3: Can do already
  - Part 4: Material from today
  - Part 5: Covered on Thursday
  - Due in two weeks

# Recursion

---

- **Recursive Definition:**

A definition that is defined in terms of itself

- **Recursive Function:**

A function that calls itself (directly or indirectly)

**PIP** stands for “**PIP** Installs Packages”

# A Mathematical Example: Factorial

---

- Non-recursive definition:

$$\begin{aligned}n! &= n \times n-1 \times \dots \times 2 \times 1 \\ &= n (n-1 \times \dots \times 2 \times 1)\end{aligned}$$

- Recursive definition:

$$n! = n (n-1)! \quad \text{for } n > 0 \quad \text{Recursive case}$$

$$0! = 1 \quad \text{Base case}$$

What happens if there is no base case?

# Factorial as a Recursive Function

```
def factorial(n):
```

```
    """Returns: factorial of n.
```

```
    Pre: n ≥ 0 an int"""
```

```
    if n == 0:
```

```
        | return 1
```

```
    return n*factorial(n-1)
```

- $n! = n (n-1)!$

- $0! = 1$

**Base case(s)**

**Recursive case**

What happens if there is no base case?

# Example: Fibonacci Sequence

---

- Sequence of numbers: 1, 1, 2, 3, 5, 8, 13, ...

$a_0$   $a_1$   $a_2$   $a_3$   $a_4$   $a_5$   $a_6$

- Get the next number by adding previous two
- What is  $a_8$ ?

A:  $a_8 = 21$

B:  $a_8 = 29$

C:  $a_8 = 34$

D: None of these.

# Example: Fibonacci Sequence

---

- Sequence of numbers: 1, 1, 2, 3, 5, 8, 13, ...

$a_0$   $a_1$   $a_2$   $a_3$   $a_4$   $a_5$   $a_6$

- Get the next number by adding previous two
- What is  $a_8$ ?

A:  $a_8 = 21$

B:  $a_8 = 29$

C:  $a_8 = 34$  **correct**

D: None of these.

# Example: Fibonacci Sequence

---

- Sequence of numbers: 1, 1, 2, 3, 5, 8, 13, ...

$$a_0 \quad a_1 \quad a_2 \quad a_3 \quad a_4 \quad a_5 \quad a_6$$

- Get the next number by adding previous two
  - What is  $a_8$ ?
- Recursive definition:
    - $a_n = a_{n-1} + a_{n-2}$       **Recursive Case**
    - $a_0 = 1$       **Base Case**
    - $a_1 = 1$       **(another) Base Case**

Why did we need two base cases this time?

# Fibonacci as a Recursive Function

---

```
def fibonacci(n):
```

```
    """Returns: Fibonacci no.  $a_n$ 
```

```
    Precondition:  $n \geq 0$  an int"""
```

```
    if n <= 1:
```

```
        | return 1
```

**Base case(s)**

```
    return (fibonacci(n-1)+  
            fibonacci(n-2))
```

**Recursive case**

Note difference with base case conditional.

# Fibonacci as a Recursive Function

```
def fibonacci(n):
```

```
    """Returns: Fibonacci no.  $a_n$ 
```

```
    Precondition:  $n \geq 0$  an int"""
```

```
    if n <= 1:
```

```
        return 1
```

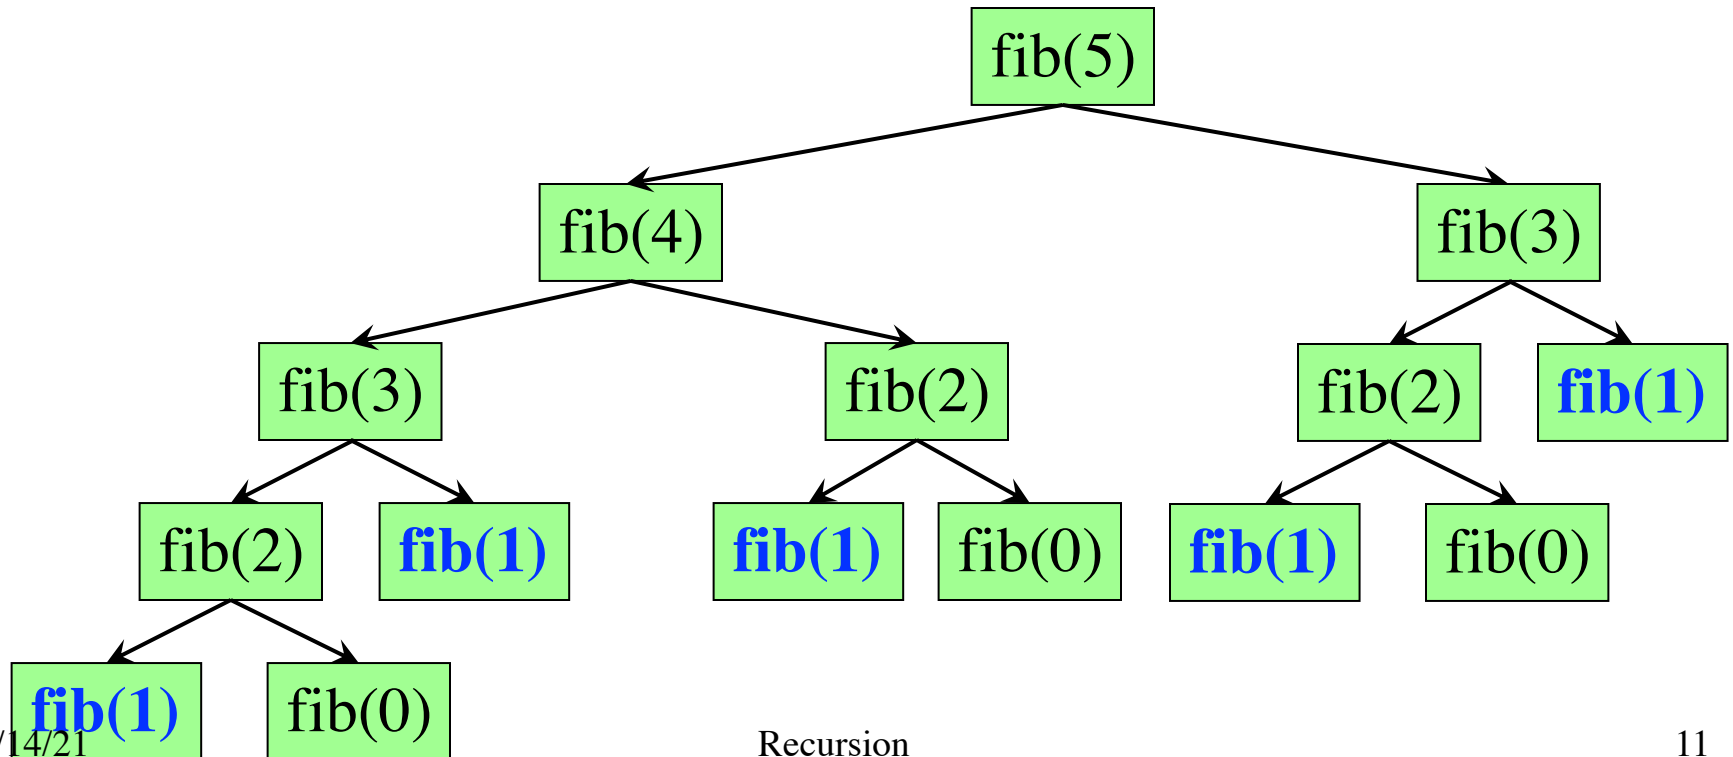

```
    return (fibonacci(n-1)+  
            fibonacci(n-2))
```

- Function that calls itself
  - Each call is new frame
  - Frames require memory
  - $\infty$  calls =  $\infty$  memory

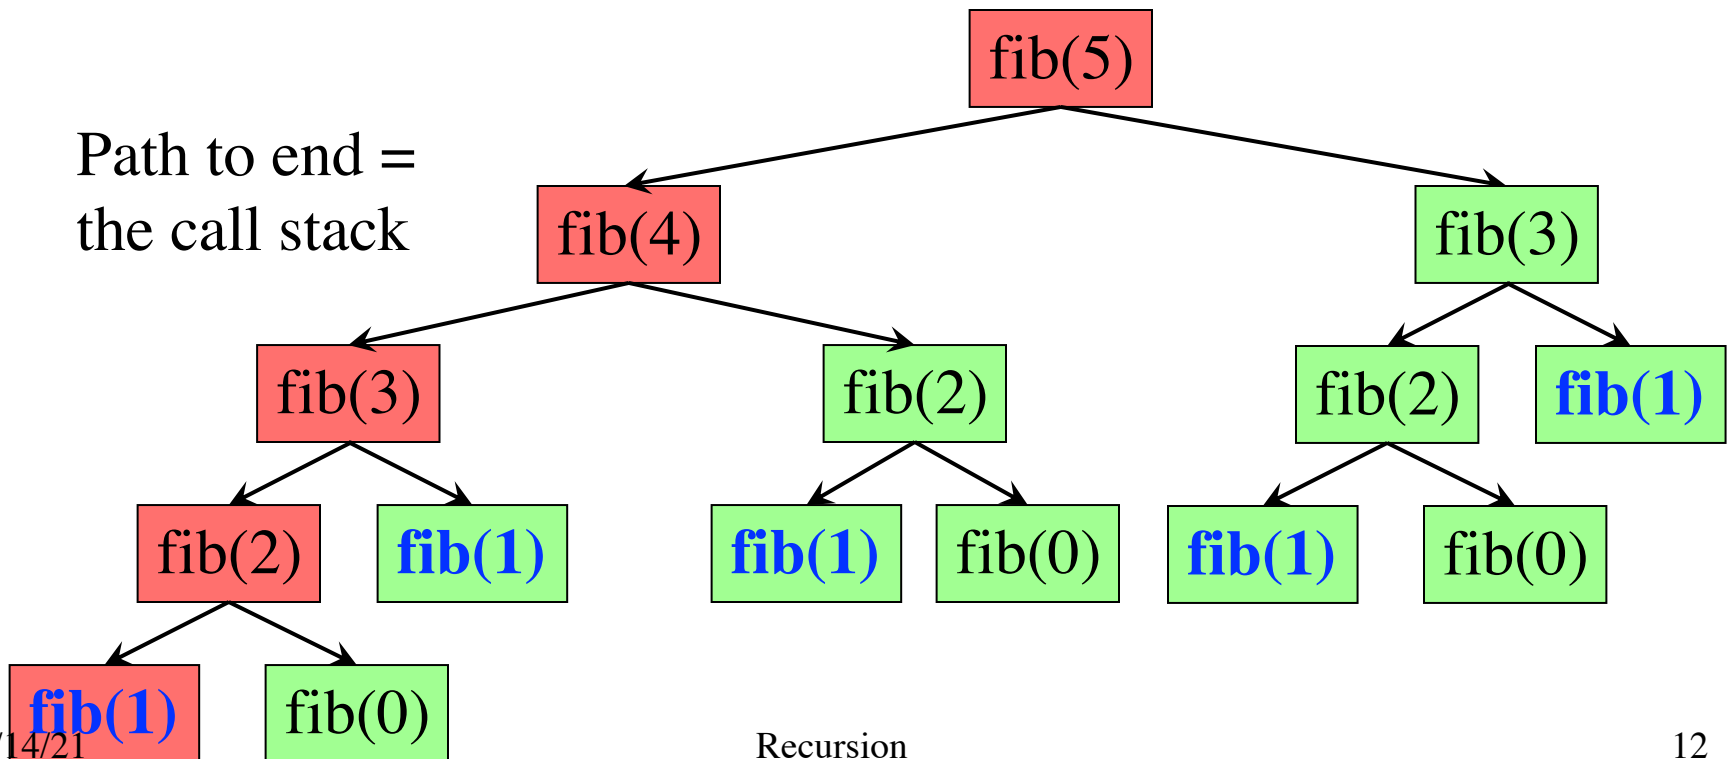

# Fibonacci: # of Frames vs. # of Calls

- Fibonacci is very inefficient.
  - $\text{fib}(n)$  has a stack that is always  $\leq n$
  - But  $\text{fib}(n)$  makes a lot of **redundant calls**

# Fibonacci: # of Frames vs. # of Calls

- Fibonacci is very inefficient.
  - $\text{fib}(n)$  has a stack that is always  $\leq n$
  - But  $\text{fib}(n)$  makes a lot of **redundant calls**

# Recursion vs Iteration

---

- **Recursion** is *provably equivalent* to **iteration**
  - Iteration includes **for-loop** and **while-loop** (later)
  - Anything can do in one, can do in the other
- But some things are easier with recursion
  - And some things are easier with iteration
- Will **not** teach you when to choose recursion
  - This is a topic for more advanced classes
- We just want you to *understand the technique*

# Recursion is best for Divide and Conquer

---

**Goal:** Solve problem P on a piece of data

**data**

# Recursion is best for Divide and Conquer

---

**Goal:** Solve problem P on a piece of data

**Idea:** Split data into two parts and solve problem

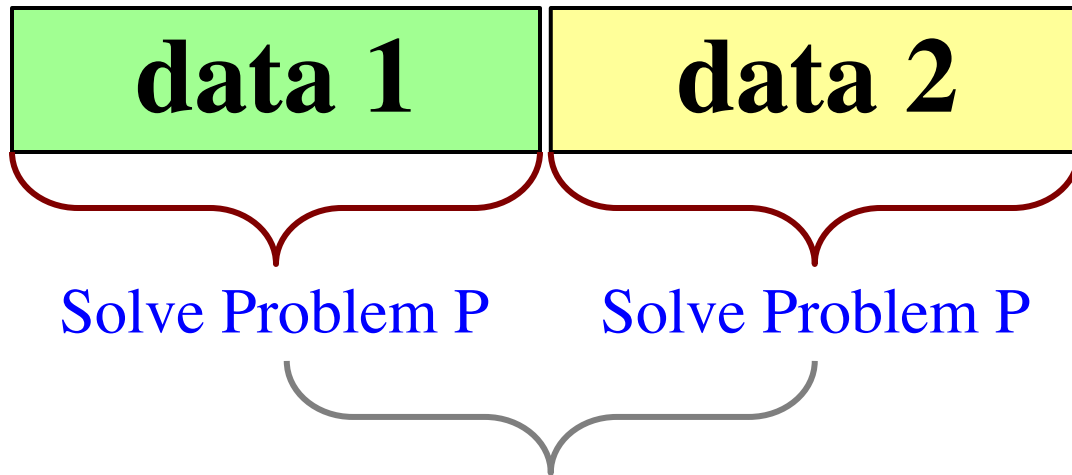

# Recursion is best for Divide and Conquer

---

**Goal:** Solve problem P on a piece of data

**Idea:** Split data into two parts and solve problem

**Combine Answer!**

# Divide and Conquer Example

---

Count the number of 'e's in a string:

Two 'e's

One 'e'

One 'e'

# Divide and Conquer Example

---

Count the number of 'e's in a string:

Two 'e's

Zero 'e's

Two 'e's

# Divide and Conquer Example

---

Count the number of 'e's in a string:

Will talk about *how* to break-up later

Zero 'e's

Two 'e's

# Three Steps for Divide and Conquer

---

1. Decide what to do on “small” data
  - Some data cannot be broken up
  - Have to compute this answer directly
2. Decide how to break up your data
  - Both “halves” should be smaller than whole
  - Often no wrong way to do this (next lecture)
3. Decide how to combine your answers
  - Assume the smaller answers are correct
  - Combining them should give bigger answer

# Divide and Conquer Example

```
def num_es(s):  
    """Returns: # of 'e's in s"""  
    # 1. Handle small data  
    if s == "":  
        | return 0  
    elif len(s) == 1:  
        | return 1 if s[0] == 'e' else 0
```

“Short-cut” for

```
if s[0] == 'e':
```

```
    return 1
```

```
else:
```

```
    return 0
```

```
# 2. Break into two parts
```

```
left = num_es(s[0])
```

```
right = num_es(s[1:])
```

```
# 3. Combine the result
```

```
return left+right
```

# Divide and Conquer Example

```
def num_es(s):
```

```
    """Returns: # of 'e's in s"""
```

```
    # 1. Handle small data
```

```
    if s == ":
```

```
        | return 0
```

```
    elif len(s) == 1:
```

```
        | return 1 if s[0] == 'e' else 0
```

Base Case

```
    # 2. Break into two parts
```

```
    left = num_es(s[0])
```

```
    right = num_es(s[1:])
```

Recursive  
Case

```
    # 3. Combine the result
```

```
    return left+right
```

# Exercise: Remove Blanks from a String

---

```
def deblank(s):  
    |   """Returns: s but with its blanks removed"""
```

## 1. Decide what to do on “small” data

- If it is the **empty string**, nothing to do

```
if s == "":  
    |   return s
```

- If it is a **single character**, delete it if a blank

```
if s == ' ':    # There is a space here  
    |   return "" # Empty string  
else:  
    |   return s
```

# Exercise: Remove Blanks from a String

---

```
def deblank(s):  
    """Returns: s but with its blanks removed"""
```

## 2. Decide how to break it up

```
left = deblank(s[0])    # A string with no blanks  
right = deblank(s[1:]) # A string with no blanks
```

## 3. Decide how to combine the answer

```
return left+right      # String concatenation
```

# Putting it All Together

```
def deblank(s):
```

```
    """Returns: s w/o blanks"""
```

```
    if s == ":
```

```
        | return s
```

```
    elif len(s) == 1:
```

```
        | return " if s[0] == ' ' else s
```

```
    left = deblank(s[0])
```

```
    right = deblank(s[1:])
```

```
    return left+right
```

Handle small data

Break up the data

Combine answers

# Putting it All Together

```
def deblank(s):
```

```
    """Returns: s w/o blanks"""
```

```
    if s == ":
```

```
        | return s
```

```
    elif len(s) == 1:
```

```
        | return " if s[0] == ' ' else s
```

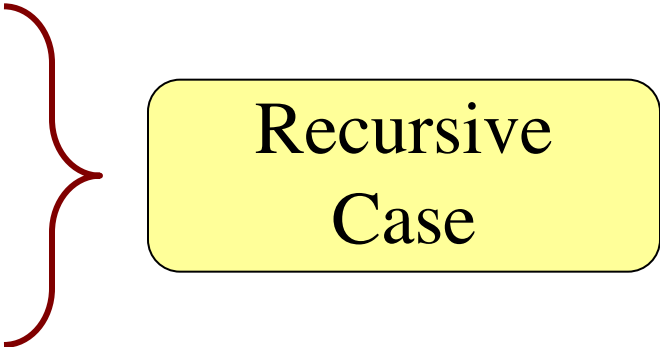

```
    left = deblank(s[0])
```

```
    right = deblank(s[1:])
```

```
    return left+right
```

Base Case

Recursive Case

# Minor Optimization

```
def deblank(s):  
    """Returns: s w/o blanks"""  
    if s == "":  
        return s  
    elif len(s) == 1:  
        return " if s[0] == ' ' else s  
  
    left = deblank(s[0])  
    right = deblank(s[1:])  
  
    return left+right
```

Needed second  
base case to  
handle s[0]

# Minor Optimization

```
def deblank(s):
```

```
    """Returns: s w/o blanks"""
```

```
    if s == ":
```

```
        | return s
```

```
    left = s[0]
```

```
    if s[0] == ' ':
```

```
        | left = "
```

```
    right = deblank(s[1:])
```

```
    return left+right
```

Eliminate the  
second base  
by combining
