

Lecture 14

Nested Lists

Announcements for This Lecture

(Optional) Videos

- **Lesson 18** for today
- **Videos 17.1-17.5** next time
- **Prelim, 10/12 at 7:30 pm**
 - Material up to **10/3**
 - Study guide is posted
 - Rooms by last name
- **Last call for conflicts!**
 - Will get email after break

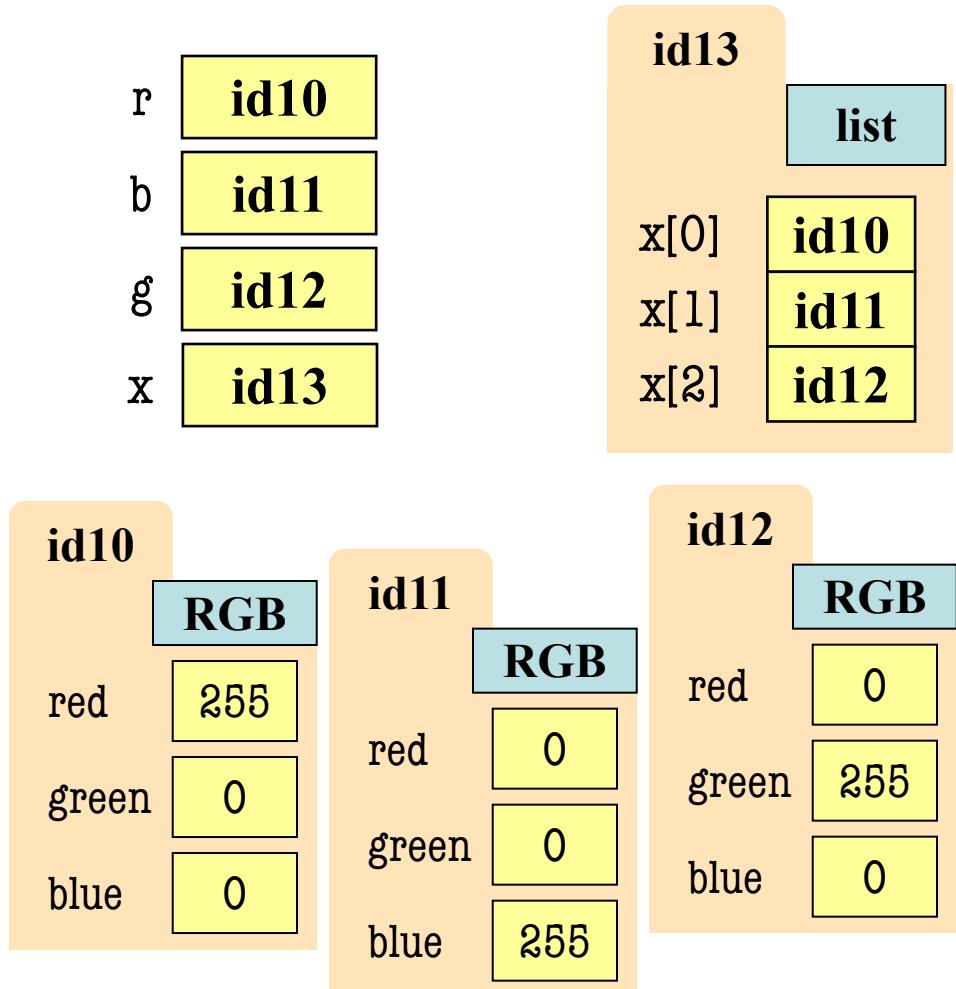

Assignments/Lab

- A3 is due **TOMORROW**
 - Survey is now posted
 - Will be graded before exam
- A4 after exam and break
 - Longer time to do this one
 - Covers for-loops
 - Also material next week
- **No real lab**
 - Just work on Assignment 3

Lists of Objects

- List positions are variables
 - Can store base types
 - But cannot store folders
 - Can store folder identifiers
- Folders linking to folders
 - Top folder for the list
 - Other folders for contents
- Example:

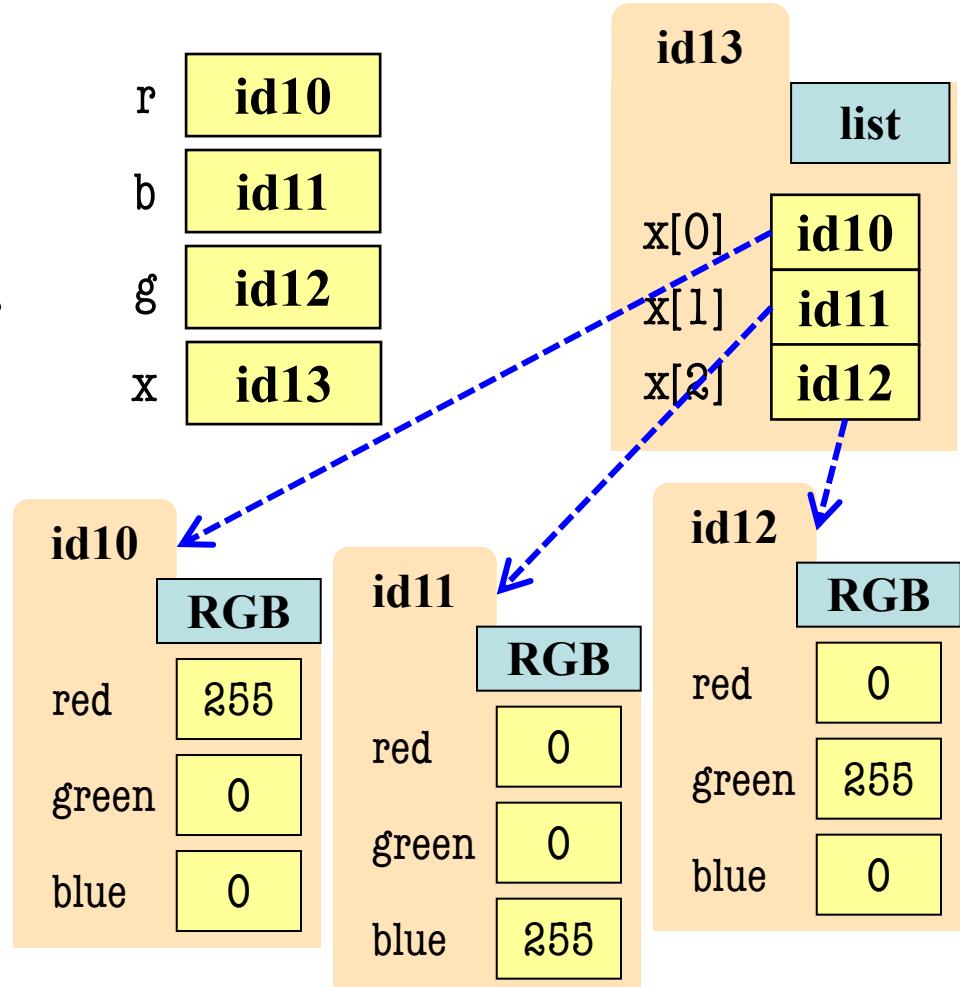

```
>>> r = introcs.RGB(255,0,0)
>>> b = introcs.RGB(0,0,255)
>>> g = introcs.RGB(0,255,0)
>>> x = [r,b,g]
```

Lists of Objects

- List positions are variables
 - Can store base types
 - But cannot store folders
 - Can store folder identifiers
- Folders linking to folders
 - Top folder for the list
 - Other folders for contents
- Example:

```
>>> r = introcs.RGB(255,0,0)
>>> b = introcs.RGB(0,0,255)
>>> g = introcs.RGB(0,255,0)
>>> x = [r,b,g]
```

Nested Lists

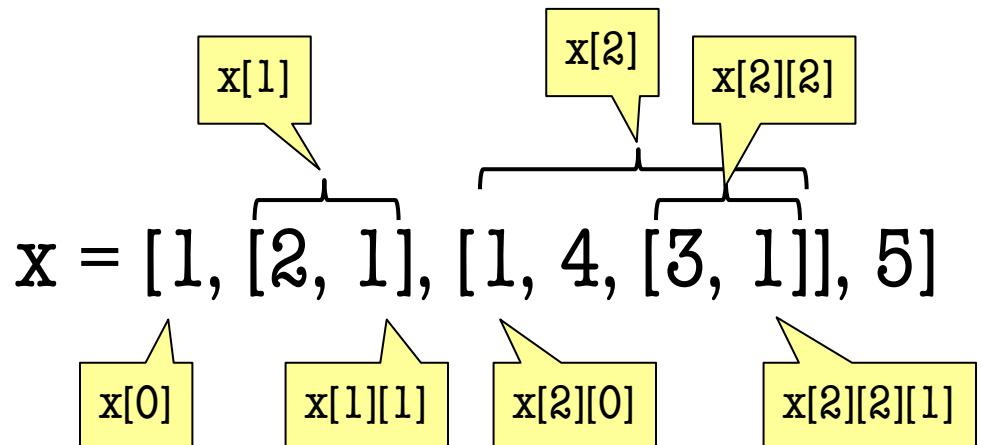

- Lists can hold any objects
- Lists are objects
- Therefore lists can hold other lists!

a = [2, 1]

b = [3, 1]

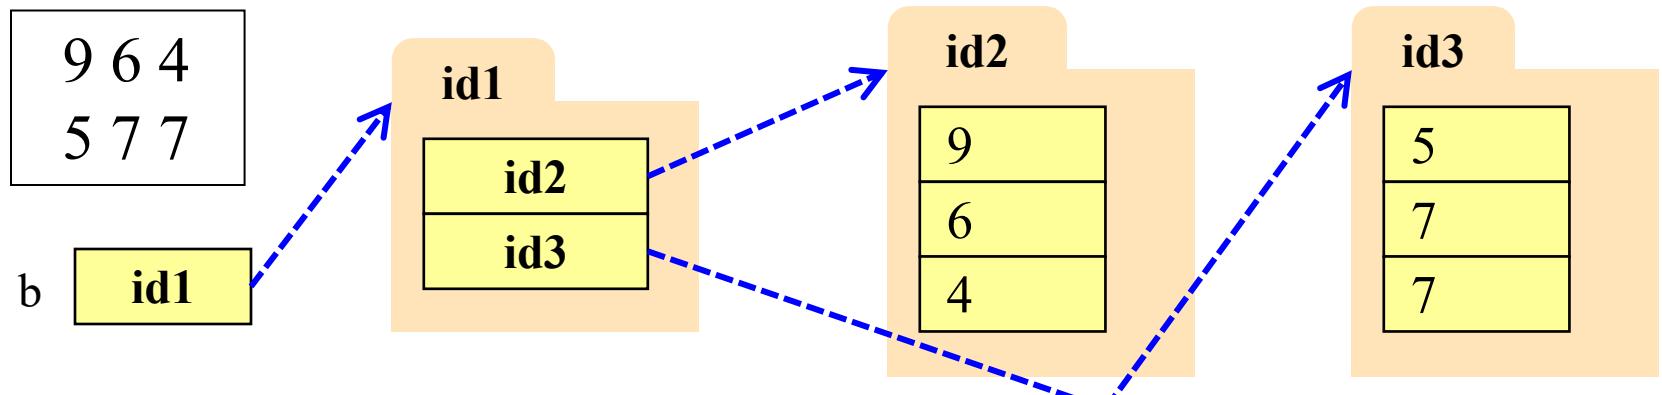

c = [1, 4, b]

x = [1, a, c, 5]

How Multidimensional Lists are Stored

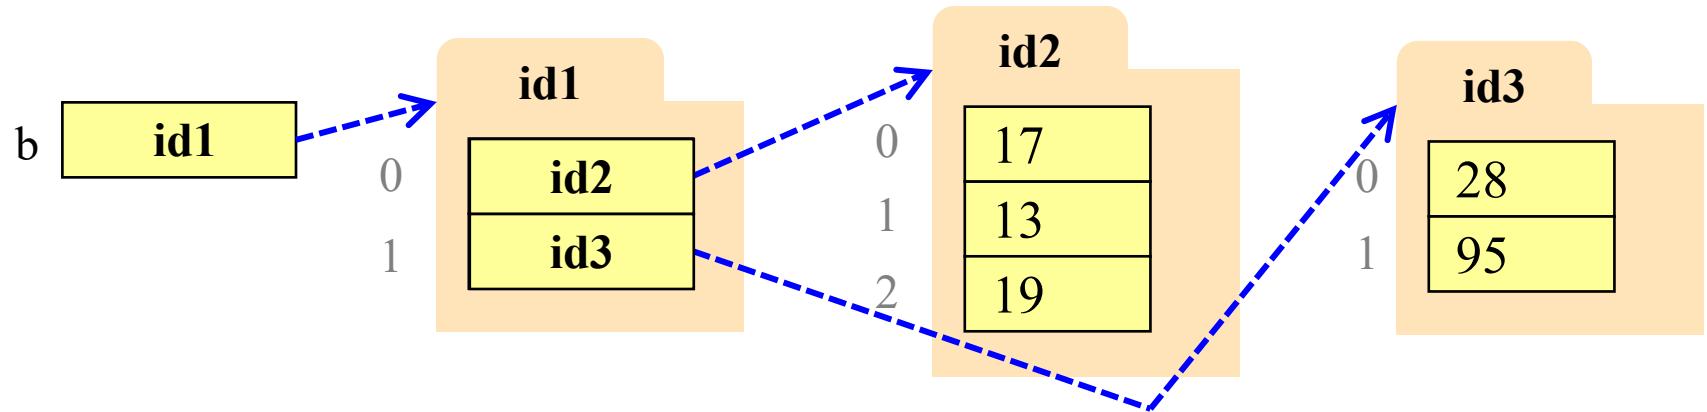

- $b = [[9, 6, 4], [5, 7, 7]]$

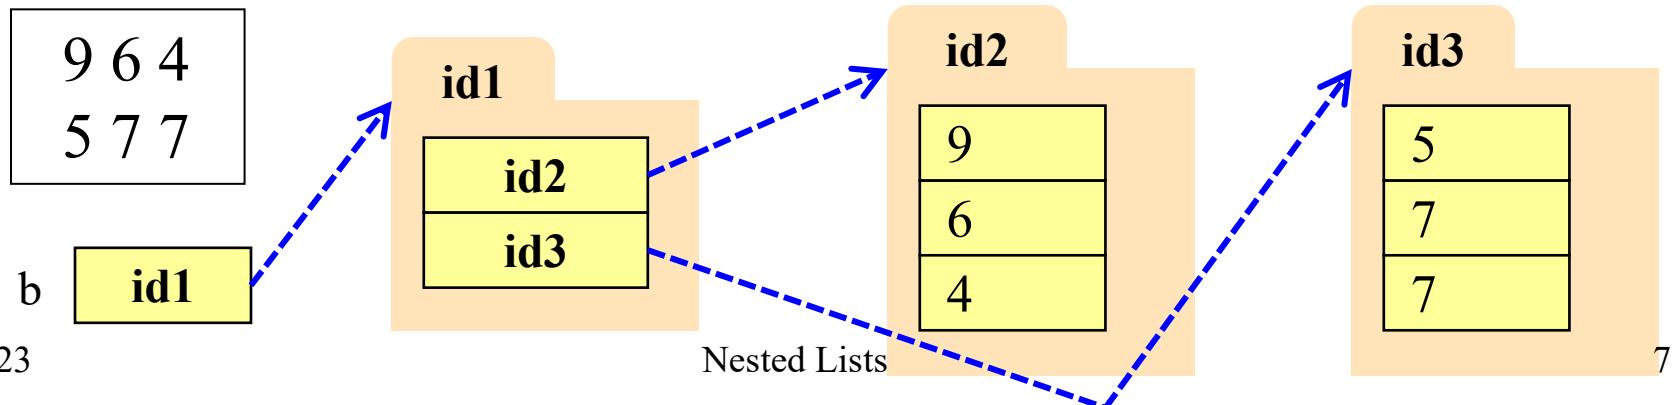

- b holds name of a two-dimensional list
 - Has $\text{len}(b)$ elements
 - Its elements are (the names of) 1D lists
- $b[i]$ holds the name of a one-dimensional list (of ints)
 - Has $\text{len}(b[i])$ elements

Ragged Lists vs Tables

- Ragged is 2d uneven list: $b = [[17, 13, 19], [28, 95]]$

- Table is 2d uniform list: $b = [[9, 6, 4], [5, 7, 7]]$

Nested Lists can Represent Tables

Spreadsheet

	0	1	2	3
0	5	4	7	3
1	4	8	9	7
2	5	1	2	3
3	4	1	2	9
4	6	7	8	0

Image

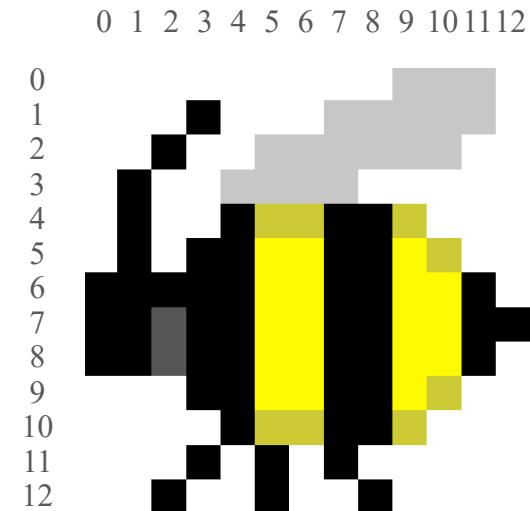

table.csv

smile.xlsx

Representing Tables as Lists

Spreadsheet

	0	1	2	3
0	5	4	7	3
1	4	8	9	7
2	5	1	2	3
3	4	1	2	9
4	6	7	8	0

Each row,
col has a
value

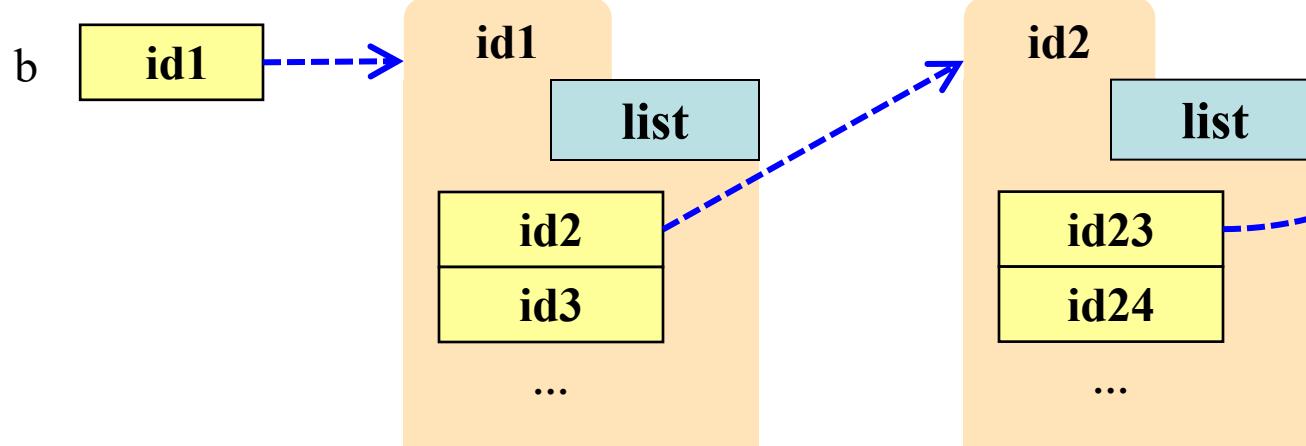

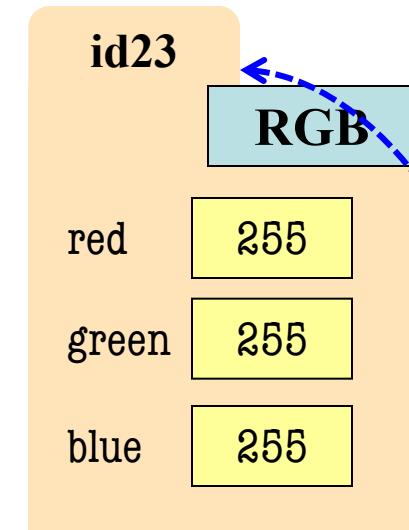

- Represent as 2d list
 - Each table row a list
 - List of all rows
 - **Row major order**
- Column major exists
 - Less common to see
 - Limited to some scientific applications

```
d = [[5,4,7,3],[4,8,9,7],[5,1,2,3],[4,1,2,9],[6,7,8,0]]
```

Image Data: 2D Lists of Pixels

smile.py

Nested Lists

Overview of Two-Dimensional Lists

- Access value at row 3, col 2:

$d[3][2]$

- Assign value at row 3, col 2:

$d[3][2] = 8$

- **An odd symmetry**

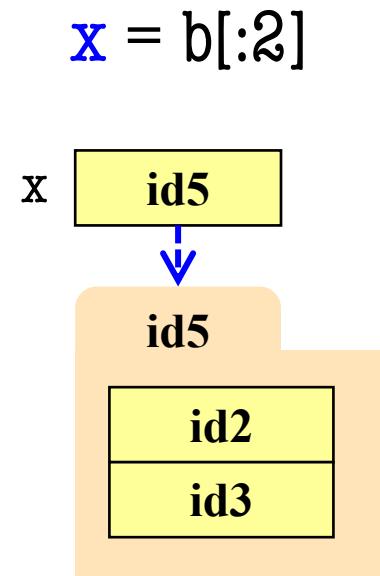

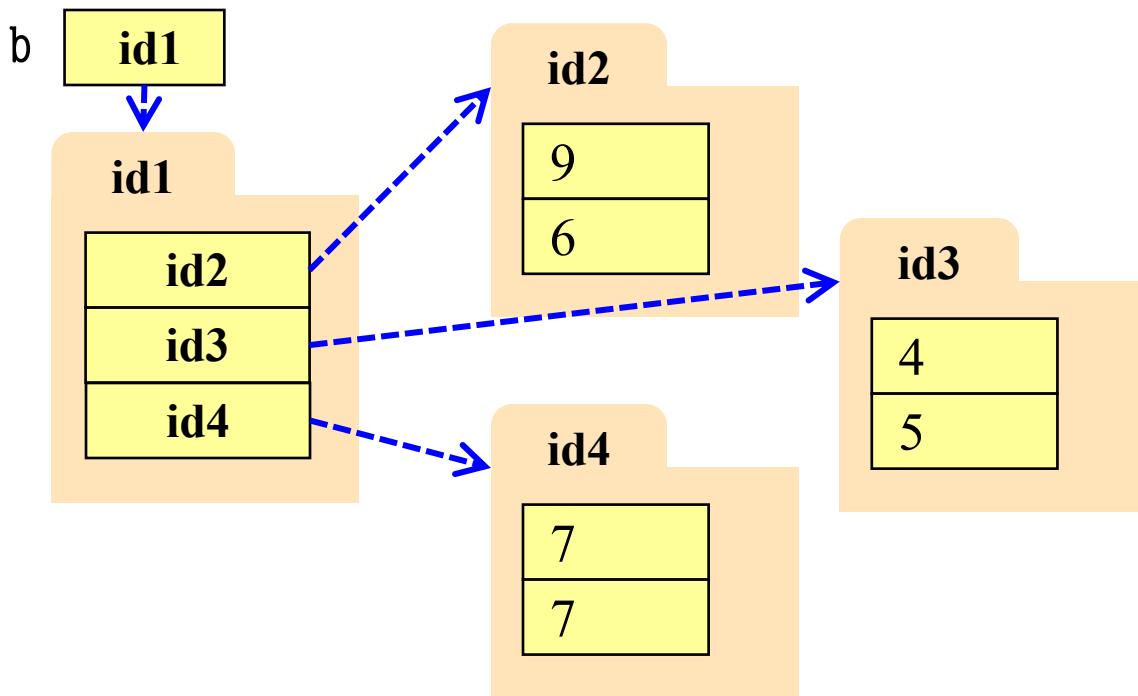

- Number of rows of d : $\text{len}(d)$

- Number of cols in row r of d : $\text{len}(d[r])$

		0	1	2	3
d	0	5	4	7	3
	1	4	8	9	7
	2	5	1	2	3
	3	4	1	2	9
	4	6	7	8	0

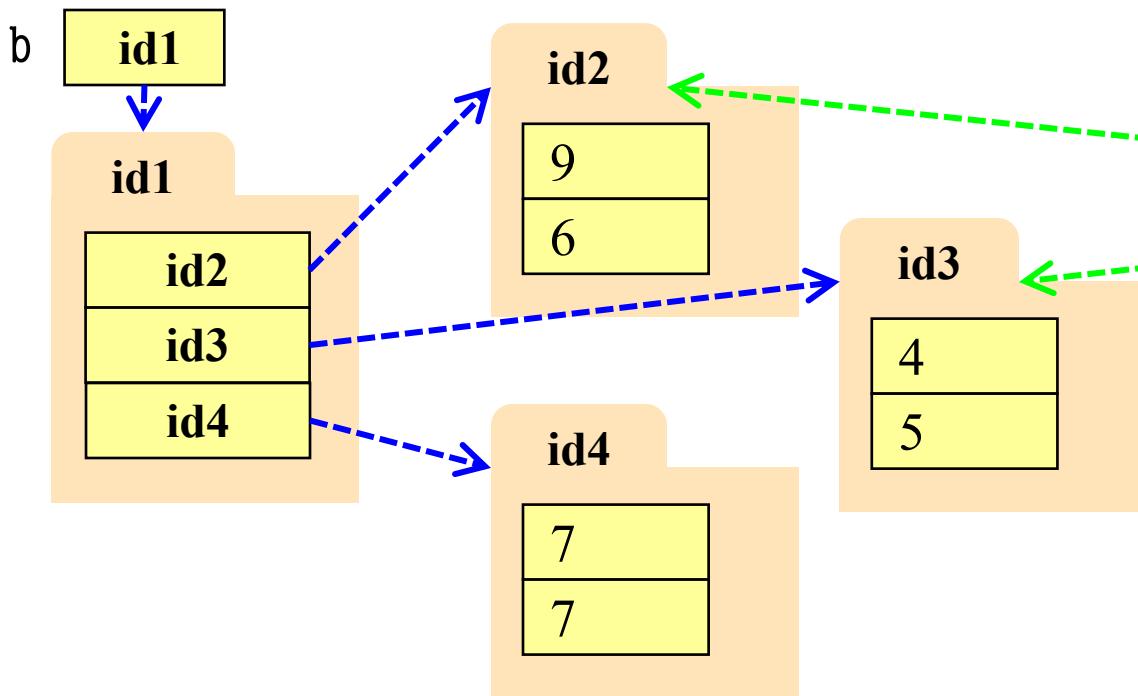

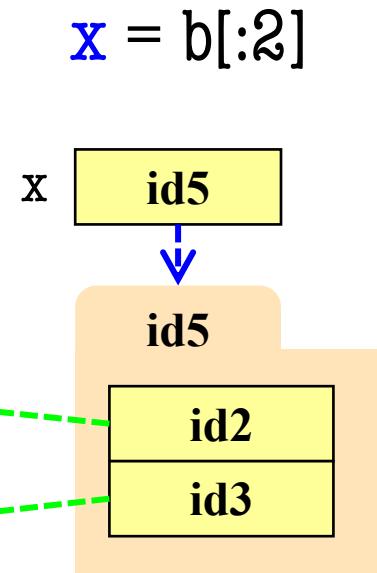

Slices and Multidimensional Lists

- Only “top-level” list is copied.
- Contents of the list are not altered
- $b = [[9, 6], [4, 5], [7, 7]]$

Slices and Multidimensional Lists

- Only “top-level” list is copied.
- Contents of the list are not altered
- $b = [[9, 6], [4, 5], [7, 7]]$

Nested Lists

Slices and Multidimensional Lists

- Create a nested list
`>>> b = [[9,6],[4,5],[7,7]]`
- Get a slice
`>>> x = b[:2]`
- Append to a row of x
`>>> x[1].append(10)`
- x now has nested list
`[[9, 6], [4, 5, 10]]`
- What are the contents of the list (with name) b?
 - A: [[9,6],[4,5],[7,7]]
 - B: [[9,6],[4,5,10]]
 - C: [[9,6],[4,5,10],[7,7]]
 - D: [[9,6],[4,10],[7,7]]
 - E: I don't know

Slices and Multidimensional Lists

- Create a nested list
`>>> b = [[9,6],[4,5],[7,7]]`
- Get a slice
`>>> x = b[:2]`
- Append to a row of x
`>>> x[1].append(10)`
- x now has nested list
`[[9, 6], [4, 5, 10]]`

- What are the contents of the list (with name) in `b`?

A: [[9,6],[4,5],[7,7]]

B: [[9,6],[4,5,10]]

C: [[9,6],[4,5,10],[7,7]]

D: [[9,6],[4,10],[7,7]]

E: I don't know

Shallow vs. Deep Copy

- **Shallow copy:** Copy top-level list
 - Happens when slice a multidimensional list
- **Deep copy:** Copy top and all nested lists
 - Requires a special function: `copy.deepcopy`
- **Example:**

```
>>> import copy  
>>> a = [[1,2],[2,3]]  
>>> b = a[:]                      # Shallow copy  
>>> c = copy.deepcopy(a)          # Deep copy
```

Functions over Nested Lists

- Functions on nested lists similar to lists
 - Go over (nested) list with *for-loop*
 - Use *accumulator* to gather the results
- But two important differences
 - Need **multiple for-loops**
 - One for each part/dimension of loop
 - In some cases need **multiple accumulators**
 - Latter true when result is new table

Simple Example

```
def all_nums(table):
    """Returns True if table contains only numbers

Precondition: table is a (non-ragged) 2d List"""

result = True
# Walk through table
for row in table:
    # Walk through the row
    for item in row:
        if not type(item) in [int,float]:
            result = False

return result
```

Accumulator

First Loop

Second Loop

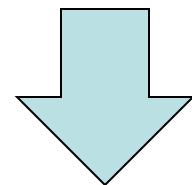

Transpose: A Trickier Example

```
def transpose(table):
    """Returns: copy of table with rows and columns swapped
    Precondition: table is a (non-ragged) 2d List"""

    result = []          # Result (new table) accumulator
    # Loop over columns
        # Add each column as a ROW to result

    return result
```

1	2
3	4
5	6

1	3	5
2	4	6

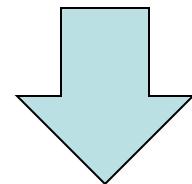

Transpose: A Trickier Example

```
def transpose(table):
    """Returns: copy of table with rows and columns swapped
    Precondition: table is a (non-ragged) 2d List"""
    numrows = len(table)      # Need number of rows
    numcols = len(table[0])   # All rows have same no. cols
    result = []               # Result (new table) accumulator

    for m in range(numcols):
        # Get the column elements at position m
        # Make a new list for this column
        # Add this row to accumulator table

    return result
```

1	2
3	4
5	6

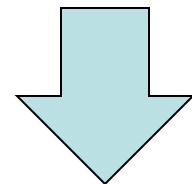

1	3	5
2	4	6

Transpose: A Trickier Example

```
def transpose(table):
    """Returns: copy of table with rows and columns swapped
    Precondition: table is a (non-ragged) 2d List"""
    numrows = len(table)      # Need number of rows
    numcols = len(table[0])   # All rows have same no. cols
    result = []               # Result (new table) accumulator
    for m in range(numcols):
        row = []               # Single row accumulator
        for n in range(numrows):
            row.append(table[n][m]) # Create a new row list
        result.append(row)       # Add result to table
    return result
```

1	2
3	4
5	6

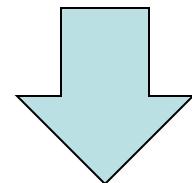

1	3	5
2	4	6

Transpose: A Trickier Example

```
def transpose(table):
    """Returns: copy of table with rows and columns swapped
    Precondition: table is a (non-ragged) 2d List"""
    numrows = len(table)      # Need number of rows
    numcols = len(table[0])   # All rows have same no. cols
    result = []
    for m in range(numcols):
        row = []
        for n in range(numrows):
            row.append(table[n][m]) # Create a new row list
        result.append(row)       # Add result to table
    return result
```

Accumulator
for each loop

1	2
3	4
5	6

1	3	5
2	4	6

Mutable Functions on Nested Lists

- Functions structure similar to that of lists
 - Do not loop over the list (modifying it)
 - Loop over *range of positions* instead
 - No *accumulator* or return statement
- But some important differences
 - May need **multiple for-loops**
 - Depends on if modifying rows or entries
 - **Modifying entries**: two loops
 - **Modifying rows**: could be one or two

A Mutable Example

```
def add_ones(table):
    """Adds one to every number in the table
    Preconditions: table is a 2d List,
    all table elements are int"""

    # Walk through table

    # Walk through each column

    # Add 1 to each element

    # No return statement
```

1	3	5
2	4	6

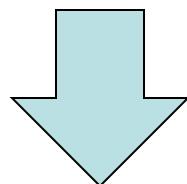

2	4	6
3	5	7

A Mutable Example

```
def add_ones(table):
    """Adds one to every number in the table
    Preconditions: table is a 2d List,
    all table elements are int"""
    # Walk through table
    for rpos in range(len(table)):
        # Walk through each column
        for cpos in range(len(table[rpos])):
            table[rpos][cpos] = table[rpos][cpos]+1
    # No return statement
```

Do not loop
over the table

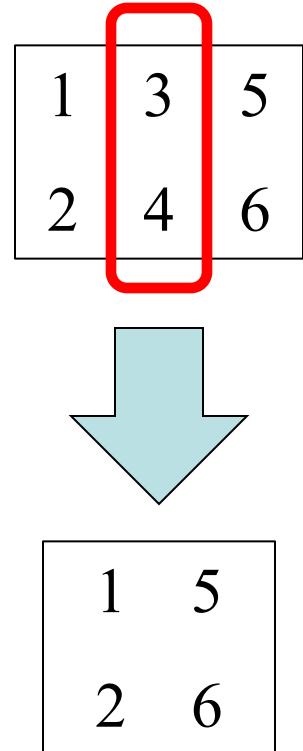

1	3	5
2	4	6

2	4	6
3	5	7

Another Example

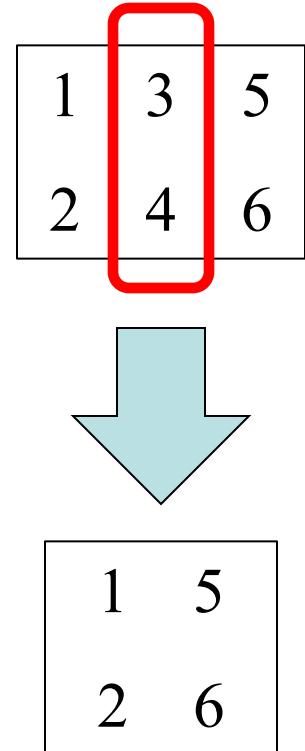

```
def strip(table,col):  
    """Removes column col from the given table  
    Preconditions: table is a (non-ragged) 2d List,  
    col valid column"""  
  
    # Walk through table  
  
    # Modify each row to slice out column  
  
    # No return statement
```

Another Example

```
def strip(table,col):  
    """Removes column col from the given table  
    Preconditions: table is a (non-ragged) 2d List,  
    col valid column"""  
  
    # Walk through table  
    for rpos in range(len(table)):  
        # Modify each row to slice out column  
        table[rpos] = table[rpos][:col] + table[rpos][col+1:]  
  
    # No return statement
```

Do not loop
over the table

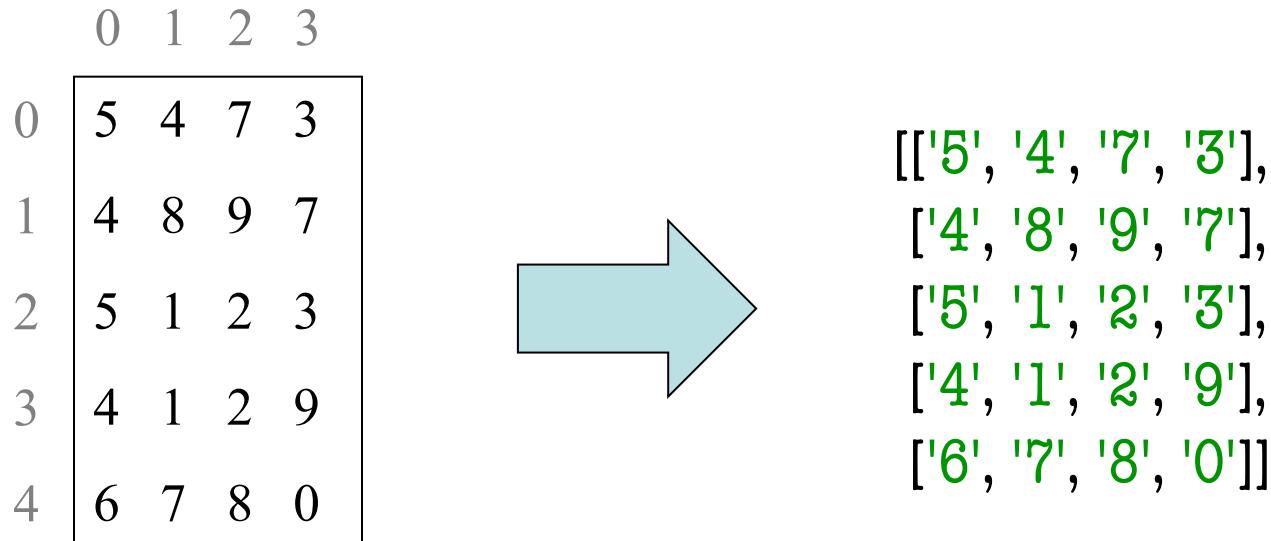

Advanced Topic: Reading CSV Files

- **Recall:** CSV (comma-separate-value) files
 - Portable way of representing tables
 - Supported by Excel and other programs
 - Can also be read as a simple text file
- Possible to load them into Python
 - **Hard way:** Using the Python csv module
 - **Easy way:** Using the introcs module
- Will revisit hard way later

Using the Function `introcs.read_csv`

- Returns a table of strings (not numbers)
 - Up to *you* to convert the data
 - Similar problem to the input function

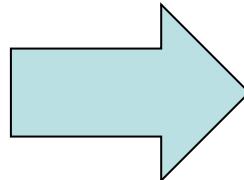

Using the Function `introcs.read_csv`

- Returns a list of lists
 - Up to `j`
 - Similar to `read_table`

Can use for-loops
to convert values!

	0	1	2	3
0	5	4	7	3
1	4	8	9	7
2	5	1	2	3
3	4	1	2	9
4	6	7	8	0

```
[['5', '4', '7', '3'],
 ['4', '8', '9', '7'],
 ['5', '1', '2', '3'],
 ['4', '1', '2', '9'],
 ['6', '7', '8', '0']]
```

Reading Data from a File

```
def read_data(file):
    """Returns: the table stored in the CSV file
    Values are converted to float if possible (remain as string if not).
    Precondition: file is the name of a CSV file"""

    # Load the file into a table

    # Access each row of the table

    # Access each element in each row

    # Convert to float if possible

    # Return the result
```

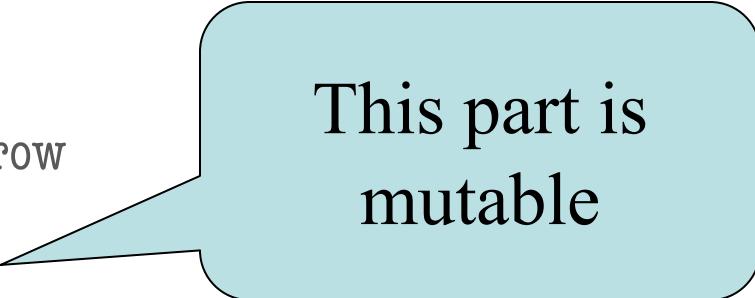

Reading Data from a File

```
def read_data(file):
    """Returns: the table stored in the CSV file
    Values are converted to float if possible (remain as string if not).
    Precondition: file is the name of a CSV file"""

    # Load the file into a table
    result = introcs.read_csv(file)
    # Access each row of the table

    # Access each element in each row
    # Convert to float if possible

    return result
```

This part is
mutable

Reading Data from a File

```
def read_data(file):
    """Returns: the table stored in the CSV file

    Values are converted to float if possible (remain as string if not).

    Precondition: file is the name of a CSV file"""

    # Load the file into a table
    result = introcs.read_csv(file)

    # Access each row of the table
    for r in range(len(result)):
        # Access each element in each row
        for c in range(len(result[r])):
            # Convert to float if possible
            try:
                result[r][c] = float(result[r][c])
            except:
                pass

    return result
```

Writing to a CSV File

- You can also write a table to a CSV file
 - **Function:** `introscs.write_csv(table,filename)`
 - File is written to your current directory
 - But there are restrictions on the table!
- Table must be a rectangular, 2d-list
- The first row must be the header
 - Header = the titles of each column
 - So all values must be strings!
- Later rows can be any type
 - Function will convert them using `str`
