Introduction to Compilers Radu Rugina

Lecture 23: Live Variable Analysis
26 Mar 06

Control Flow Graphs

- Control Flow Graph (CFG) = graph representation of computation and control flow in the program
 - framework to statically analyze program control-flow
- In a CFG:
 - Nodes are basic blocks; they represent computation
 - Edges characterize control flow between basic blocks
- Can build the CFG representation either from the high IR or from the low IR

From Three-Address Code to CFG

```
label L1
fjump c L2
x = y + 1;
y = 2 * z;
fjump d L3
x = y+z;
label L3
z = 1;
jump L1
label L2
z = x;
```

Basic Blocks

```
label L1
fjump c L2
x = y + 1;
y = 2 * z;
fjump d L3
x = y+z;
label L3
z = 1;
jump L1
label L2
z = x;
```

Using CFGs

- Next: use CFG representation to statically extract information about the program
 - Reason at compile-time
 - About the run-time values of variables and expressions in all program executions
- Extracted information example: live variables
- Idea:
 - Define program points in the CFG
 - Reason statically about how the information flows between these program points

Program Points

- Two program points for each instruction:
 - There is a program point before each instruction
 - There is a program point after each instruction
-
- ```
graph LR
 P1((Point before)) --> I[x = y+1]
 I --> P2((Point after))
```
- In a basic block:
    - Program point after an instruction = program point before the successor instruction

## Program Points: Example

- Multiple successor CFG nodes:
  - control will flow to one of the successor program points
  - It is not statically known which one
- Similar situation when there are multiple predecessor CFG nodes
- How does information propagate between program points?

CS 412/413 Spring 2006

Introduction to Compilers

7

## Flow of Extracted Information

- Question 1: how does information flow between the program points before and after an instruction?
- Question 2: how does information flow between different CFG nodes?
- ... in other words:
  - Q1: what is the effect of computation?
  - Q2: what is the effect of control flow?

CS 412/413 Spring 2006

Introduction to Compilers

8

## Using CFGs

- To extract information: reason about how it propagates between program points
- Rest of this lecture: how to use CFGs to compute information at each program point for:
  - Live variable analysis, which computes live variables are live at each program point
  - Copy propagation analysis, which computes the variable copies available at each program point

CS 412/413 Spring 2006

Introduction to Compilers

9

## Live Variable Analysis

- Using the CFG structure to perform live variable analysis
  - A variable is live if its value might be needed later
  - Goal: compute all live variables at each program point
- For each CFG node  $n$ , consider:
  - $in[n]$  = live variables at program point before  $n$
  - $out[n]$  = live variables at program point after  $n$
- CFG node can be either:
  - An instruction  $I$
  - A basic block  $B$

Introduction to Compilers

10

## How to Compute Liveness?

- Answer question 1: for each CFG node  $n$ , what is the relation between  $in[n]$  and  $out[n]$  ?
- Answer question 2: for each CFG node  $n$  with successors  $n_1, \dots, n_k$ , what is the relation between  $out[n]$  and  $in[n_1], \dots, in[n_k]$  ?

CS 412/413 Spring 2006

Introduction to Compilers

11

## Part 1: Analyze Instructions

- Question: what is the relation between sets of live variables before and after a node?
- Examples:
 

|                  |                     |                     |
|------------------|---------------------|---------------------|
| $in[n] = ?$      | $in[n] = ?$         | $in[n] = ?$         |
| $x = y+z$        | $x = y+z$           | $x = x+z$           |
| $out[n] = \{z\}$ | $out[n] = \{x, t\}$ | $out[n] = \{x, t\}$ |
- ... is there a general rule?

CS 412/413 Spring 2006

Introduction to Compilers

12

## Analyze Instructions

- Yes: knowing variables live after  $n$ , we can compute variables live before  $n$ :
 

|         |     |          |
|---------|-----|----------|
| $in[n]$ | $n$ | $out[n]$ |
|---------|-----|----------|

  - All variables live after  $n$  are also live before  $n$ , unless  $n$  defines (writes) them
  - All variables that  $n$  uses (reads) are also live before instruction  $n$
- Mathematically:
 
$$in[n] = (out[n] - def[n]) \cup use[n]$$

where:

  - $def[n]$  = variables defined (written) by node  $n$
  - $use[n]$  = variables used (read) by node  $n$

CS 412/413 Spring 2006

Introduction to Compilers

13

## Computing Use/Def

- Compute  $use[n]$  and  $def[n]$  for each instruction:
 

|                                      |                                |                  |
|--------------------------------------|--------------------------------|------------------|
| if $n$ is $x = y$ OP $z$ :           | $use[n] = \{y, z\}$            | $def[n] = \{x\}$ |
| if $n$ is $x = OP y$ :               | $use[n] = \{y\}$               | $def[n] = \{x\}$ |
| if $n$ is $x = y$ :                  | $use[n] = \{y\}$               | $def[n] = \{x\}$ |
| if $n$ is if $(x)$ :                 | $use[n] = \{x\}$               | $def[n] = \{\}$  |
| if $n$ is return $x$ :               | $use[n] = \{x\}$               | $def[n] = \{\}$  |
| if $n$ is $x = f(y_1, \dots, y_n)$ : | $use[n] = \{y_1, \dots, y_n\}$ | $def[n] = \{x\}$ |

(For now, ignore load and store instructions)

CS 412/413 Spring 2006

Introduction to Compilers

14

## Example

- Example: three consecutive instructions  $I1, I2, I3$ :
 

|                            |      |             |
|----------------------------|------|-------------|
| $Live1 = in[I1]$           |      | $Live1$     |
| $Live2 = out[I1] = in[I2]$ | $I1$ | $x = y+1$   |
| $Live3 = out[I2] = in[I3]$ |      | $Live2$     |
| $Live4 = out[I3]$          | $I2$ | $y = 2 * z$ |
|                            |      | $Live3$     |
|                            | $I3$ | if $(d)$    |
|                            |      | $Live4$     |
- Relation between Live sets:
 

|                                      |
|--------------------------------------|
| $Live1 = (Live2 - \{x\}) \cup \{y\}$ |
| $Live2 = (Live3 - \{y\}) \cup \{z\}$ |
| $Live3 = (Live4 - \{\}) \cup \{d\}$  |

CS 412/413 Spring 2006

Introduction to Compilers

15

## Backward Flow

- Relation:
 
$$in[I] = (out[I] - def[I]) \cup use[I]$$
- Can compute  $in[I]$  if we know  $out[I]$
- The information flows backward

CS 412/413 Spring 2006

Introduction to Compilers

16

## Part 2: Analyze Control Flow

- Question: for each node  $n$  with successor blocks  $n_1, \dots, n_k$ , what is the relation between  $out[n]$  and  $in[n_1], \dots, in[n_k]$ ?
- Examples:
 

|                                                                                                         |            |               |                                                                                                         |            |               |                                                                                                     |         |       |                                                                                                     |         |       |                                                                                                     |         |       |
|---------------------------------------------------------------------------------------------------------|------------|---------------|---------------------------------------------------------------------------------------------------------|------------|---------------|-----------------------------------------------------------------------------------------------------|---------|-------|-----------------------------------------------------------------------------------------------------|---------|-------|-----------------------------------------------------------------------------------------------------|---------|-------|
| <table border="1"> <tr><td><math>n</math></td></tr> <tr><td><math>\{x, y, z\}</math></td></tr> </table> | $n$        | $\{x, y, z\}$ | <table border="1"> <tr><td><math>n</math></td></tr> <tr><td><math>\{x, y, z\}</math></td></tr> </table> | $n$        | $\{x, y, z\}$ |                                                                                                     |         |       |                                                                                                     |         |       |                                                                                                     |         |       |
| $n$                                                                                                     |            |               |                                                                                                         |            |               |                                                                                                     |         |       |                                                                                                     |         |       |                                                                                                     |         |       |
| $\{x, y, z\}$                                                                                           |            |               |                                                                                                         |            |               |                                                                                                     |         |       |                                                                                                     |         |       |                                                                                                     |         |       |
| $n$                                                                                                     |            |               |                                                                                                         |            |               |                                                                                                     |         |       |                                                                                                     |         |       |                                                                                                     |         |       |
| $\{x, y, z\}$                                                                                           |            |               |                                                                                                         |            |               |                                                                                                     |         |       |                                                                                                     |         |       |                                                                                                     |         |       |
| <table border="1"> <tr><td><math>\{x, z\}</math></td></tr> <tr><td><math>n_1</math></td></tr> </table>  | $\{x, z\}$ | $n_1$         | <table border="1"> <tr><td><math>\{x, y\}</math></td></tr> <tr><td><math>n_2</math></td></tr> </table>  | $\{x, y\}$ | $n_2$         | <table border="1"> <tr><td><math>\{x\}</math></td></tr> <tr><td><math>n_1</math></td></tr> </table> | $\{x\}$ | $n_1$ | <table border="1"> <tr><td><math>\{y\}</math></td></tr> <tr><td><math>n_2</math></td></tr> </table> | $\{y\}$ | $n_2$ | <table border="1"> <tr><td><math>\{z\}</math></td></tr> <tr><td><math>n_3</math></td></tr> </table> | $\{z\}$ | $n_3$ |
| $\{x, z\}$                                                                                              |            |               |                                                                                                         |            |               |                                                                                                     |         |       |                                                                                                     |         |       |                                                                                                     |         |       |
| $n_1$                                                                                                   |            |               |                                                                                                         |            |               |                                                                                                     |         |       |                                                                                                     |         |       |                                                                                                     |         |       |

| $n_3$                                                                                                   |            |               |                                                                                                         |            |               |                                                                                                     |         |       |                                                                                                     |         |       |                                                                                                     |         |       |
- What is the general rule?

CS 412/413 Spring 2006

Introduction to Compilers

17

## Analyze Control Flow

- Rule: A variable is live at a program point if it is live at one of the successor points
- Characterizes all possible program executions
- Mathematically:
 
$$out[n] = \bigcup_{n' \in succ(n)} in[n']$$
- Again, information flows backward: from successors  $n'$  of  $n$ , to  $n$  itself

CS 412/413 Spring 2006

Introduction to Compilers

18

## Constraint System

- Put parts together: start with CFG and derive a system of constraints between live variable sets:

$$\begin{cases} \text{in}[n] = ( \text{out}[n] - \text{def}[n] ) \cup \text{use}[n] \\ \text{out}[n] = \bigcup_{n' \in \text{succ}(n)} \text{in}[n'] \end{cases} \text{ for each node } n$$

- Solve constraints:
  - Start with empty sets of live variables
  - Iteratively apply constraints
  - Stop when we reach a fixed point

CS 412/413 Spring 2006

Introduction to Compilers

19

## Constraint Solving Algorithm

For all CFG nodes  $n$ :  $\text{in}[n] = \text{out}[n] = \emptyset$   
 worklist = all "return" (exit) nodes

```
while (worklist is not empty)
 remove n from worklist
 in[n] = (out[n] - def[n]) ∪ use[n]

 for each predecessor n':
 out[n'] = out[n] ∪ in[n]
 if (out[n'] changed)
 add n' to worklist
```

## Example: Live Variable Analysis

CS 412/413 Spring 2006

Introduction to Compilers

21

## Copy Propagation

- Goal: determine copies available at each program point
- Information: set of copies  $\langle x=y \rangle$  at each point
- For each CFG node:
  - $\text{in}[n]$  = copies available at program point before  $n$
  - $\text{out}[n]$  = copies available at program point after  $n$

CS 412/413 Spring 2006

Introduction to Compilers

22

## Copy Propagation Analysis

- Knowing  $\text{in}[n]$ , we can compute  $\text{out}[n]$ :
  - Remove from  $\text{in}[n]$  all copies  $\langle u=v \rangle$  if variable  $u$  or  $v$  is written by  $n$
  - Keep all other copies from  $\text{in}[n]$
  - If  $n$  is of the form  $x=y$ , add  $\langle x=y \rangle$  to  $\text{out}[n]$
- A copy is available at point before  $n$  if it is available at the end of all predecessor program points

CS 412/413 Spring 2006

Introduction to Compilers

23

## Example: Copy Propagation

- What are the available copies at the end of the program?

$x=y?$   
 $z=t?$   
 $x=z?$

CS 412/413 Spring 2006

Introduction to Compilers

24

## Summary

- Extracting information about live variables, available copies:
  - Define the required information
  - Build constraints for instructions/control flow
  - Solve constraints to get needed information
- ...is there a general framework?
  - Yes: dataflow analysis!
