

- An FD is a statement about *all* allowable relations.
- Must be identified based on semantics of application.
- Given some allowable instance r1 of R, we can check if it
- violates some FD *f*, but we cannot tell if *f* holds over R!
- K is a candidate key for R means that  $K \rightarrow R$
- However,  $K \rightarrow R$  does not require K to be *minimal*! ise Management Systems, R. Ramakrishnan and J. C

- rating determines  $hrly\_wages: R \rightarrow W$
- e Management Systems, R. Ramakrishnan and J. Gehrke

#### Reasoning About FDs

- \* Given some FDs, we can usually infer additional FDs:  $-ssn \rightarrow did, did \rightarrow lot$  implies  $ssn \rightarrow lot$
- ♦ An FD *f* is *implied by* a set of FDs *F* if *f* holds whenever all FDs in F hold.
- $F^+$  = *closure of* F is the set of all FDs that are implied by F.
- Armstrong's Axioms (X, Y, Z are sets of attributes): *Reflexivity:* If  $X \subseteq Y$ , then  $X \to Y$

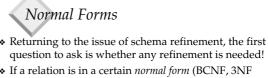

Database Management Systems, R. Ramakrishnan and J. Gehrke

- <u>Augmentation</u>: If  $X \rightarrow Y$ , then  $XZ \rightarrow YZ$  for any Z
- <u>Transitivity</u>: If  $X \to Y$  and  $Y \to Z$ , then  $X \to Z$ These are sound and complete inference rules for FDs!

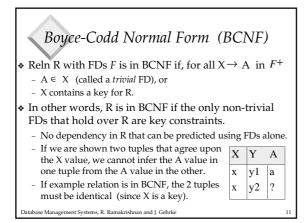

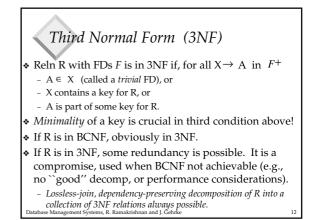

atabase Management Systems, R. Ramakrishnan and J. Gehrke

- etc.), it is known that certain kinds of problems are avoided/minimized. This can be used to help us decide whether decomposing the relation will help. Role of FDs in detecting redundancy:
- Consider a relation R with 3 attributes, ABC.

  - No FDs hold: There is no redundancy here.
  - Given  $A \rightarrow B$ : Several tuples could have the same A value, and if so, they'll all have the same B value! n and J. Gehrl

#### What Does 3NF Achieve?

- ◆ If 3NF violated by X→A, one of the following holds:
   X is a subset of some key K
  - We store (X, A) pairs redundantly.
  - X is not a proper subset of any key.

Database Management Systems, R. Ramakrishnan and J. Gehrke

- There is a chain of FDs  $K \rightarrow X \rightarrow A$ , which means that we cannot associate an X value with a K value unless we also associate an A value with an X value.
- But: even if reln is in 3NF, these problems could arise.
  e.g., Reserves SBDC, S → C, C → S is in 3NF, but for each reservation of sailor S, same (S, C) pair is stored.
- Thus, 3NF is indeed a compromise relative to BCNF.

Decomposition of a Relation Scheme Suppose that relation R contains attributes *A1* ... *An*.

- A <u>decomposition</u> of R consists of replacing R by two or more relations such that:
  - Each new relation scheme contains a subset of the attributes of R (and no attributes that do not appear in R), and
  - Every attribute of R appears as an attribute of one of the new relations.

 Intuitively, decomposing R means we will store instances of the relation schemes produced by the decomposition, instead of instances of R.

E.g., Can decompose SNLRWH into SNLRH and RW. Database Management Systems, R. Ramakrishnan and J. Gehrke 14

# Example Decomposition

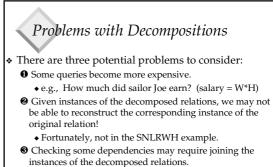

\* Decompositions should be used only when needed.

- SNLRWH has FDs S  $\rightarrow$  SNLRWH and R  $\rightarrow$  W
- Second FD causes violation of 3NF; W values repeatedly associated with R values. Easiest way to fix this is to create a relation RW to store these associations, and to remove W from the main schema:

 $\bullet$  i.e., we decompose SNLRWH into SNLRH and RW

The information to be stored consists of SNLRWH tuples. If we just store the projections of these tuples onto SNLRH and RW, are there any potential problems that we should be aware of?

Database Management Systems, R. Ramakrishnan and J. Gehrke

• Fortunately, not in the SNLRWH example.

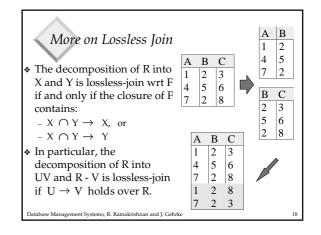

<u>*Tradeoff*</u>: Must consider these issues vs. redundancy.

tabase Management Systems, R. Ramakrishnan and J. Gehrke

# Lossless Join Decompositions

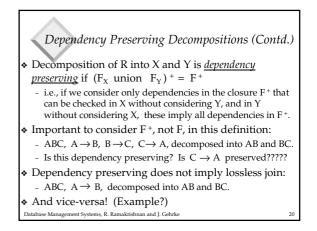

- ◆ Decomposition of R into X and Y is <u>lossless-join</u> w.r.t. a set of FDs F if, for every instance r that satisfies F: -  $\pi_x(r) \bowtie \pi_y(r) = r$
- It is always true that  $r \subseteq \pi_x(r) \bowtie \pi_y(r)$
- In general, the other direction does not hold! If it does, the decomposition is lossless-join.
- Definition extended to decomposition into 3 or more relations in a straightforward way.
- It is essential that all decompositions used to deal with redundancy be lossless! (Avoids Problem (2).)

Database Management Systems, R. Ramakrishnan and J. Gehrke

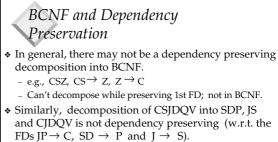

#### Dependency Preserving Decomposition

- ♦ Consider CSJDPQV, C is key, JP  $\rightarrow$  C and SD  $\rightarrow$  P. - BCNF decomposition: CSJDQV and SDP
  - Problem: Checking JP  $\rightarrow$  C requires a join!
- Dependency preserving decomposition (Intuitive):
- If R is decomposed into X, Y and Z, and we enforce the FDs that hold on X, on Y and on Z, then all FDs that were given to hold on R must also hold. (Avoids Problem (3).)
- Projection of set of FDs F: If R is decomposed into X, ... projection of F onto X (denoted  $F_x$ ) is the set of FDs  $U \rightarrow V$  in  $F^+$  (*closure of F*) such that U, V are in X.
- Database Management Systems, R. Ramakrishnan and J. Gehrke

## Decomposition into BCNF

- ♦ Consider relation R with FDs F. If  $X \rightarrow Y$  violates BCNF, decompose R into R - Y and XY.
  - Repeated application of this idea will give us a collection of relations that are in BCNF; lossless join decomposition, and guaranteed to terminate.
  - e.g., CSJDPQV, key C, JP $\rightarrow$  C, SD $\rightarrow$  P, J $\rightarrow$  S
  - To deal with SD  $\rightarrow$  P, decompose into SDP, CSJDQV.
  - To deal with J → S, decompose CSJDQV into JS and CJDQV
- In general, several dependencies may cause violation of BCNF. The order in which we ``deal with" them could lead to very different sets of relations! atabase Management Systems, R. Ramakrishnan and J. Gehrko

- However, it is a lossless join decomposition.
- In this case, adding JPC to the collection of relations gives us a dependency preserving decomposition. ◆ JPC tuples stored only for checking FD! (Redundancy!)
  - stems, R. Ramakrishnan and J. Gehrke agement Sy

## Decomposition into 3NF

- \* Obviously, the algorithm for lossless join decomp into BCNF can be used to obtain a lossless join decomp into 3NF (typically, can stop earlier).
- \* To ensure dependency preservation, one idea:
- If  $X \rightarrow Y$  is not preserved, add relation XY.
- Problem is that XY may violate 3NF! e.g., consider the addition of CJP to `preserve' JP → C. What if we also have  $J \rightarrow C$ ?
- Refinement: Instead of the given set of FDs F, use a minimal cover for F.

ent Systems, R. Ramakrishnan and I. Gehrk

#### Minimal Cover for a Set of FDs ♦ <u>Minimal cover</u> G for a set of FDs F: - Closure of F = closure of G. - Right hand side of each FD in G is a single attribute. - If we modify G by deleting an FD or by deleting attributes from an FD in G, the closure changes. Intuitively, every FD in G is needed, and ``as small as possible" in order to get the same closure as F.

- ♦ e.g.,  $A \rightarrow B$ , ABCD  $\rightarrow E$ , EF  $\rightarrow$  GH, ACDF  $\rightarrow$  EG has the following minimal cover:
  - A $\rightarrow$  B, ACD $\rightarrow$  E, EF $\rightarrow$  G and EF $\rightarrow$  H
- ♦ M.C. → Lossless-Join, Dep. Pres. Decomp!!! (in book)

### Summary of Schema Refinement

- If a relation is in BCNF, it is free of redundancies that can be detected using FDs. Thus, trying to ensure that all relations are in BCNF is a good heuristic.
- If a relation is not in BCNF, we can try to decompose it into a collection of BCNF relations.
  - Must consider whether all FDs are preserved. If a losslessjoin, dependency preserving decomposition into BCNF is not possible (or unsuitable, given typical queries), should consider decomposition into 3NF.
  - Decompositions should be carried out and/or re-examined while keeping *performance requirements* in mind.
