

Relational Database: Definitions

- * Relational database: a set of relations
- * *Relation:* made up of 2 parts:
 - *Instance* : a *table*, with rows and columns. #Rows = *cardinality*, #fields = *degree* / *arity*. _

 - *Schema* : specifies name of relation, plus name and type of each column.
 - E.G. Students(sid: string, name: string, login: string, age: integer, gpa: real).
- ✤ Can think of a relation as a set of rows or *tuples* (i.e., all rows are distinct).

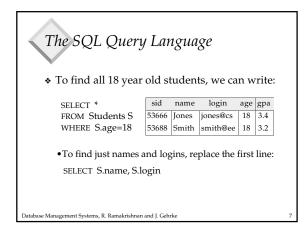

Relational Query Languages

- A major strength of the relational model: supports simple, powerful *querying* of data.
- Queries can be written intuitively, and the DBMS is responsible for efficient evaluation.
 - The key: precise semantics for relational queries.
 Allows the optimizer to extensively re-order operations, and still ensure that the answer does not change.

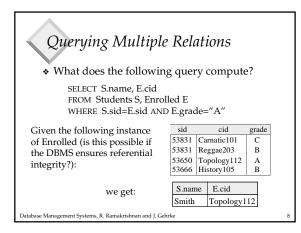

Database Management Systems, R. Ramakrishnan and J. Gehrke

The SQL Query Language

- Developed by IBM (system R) in the 1970s
- Need for a standard since it is used by many vendors
- * Standards:
 - SQL-86
 - SQL-89 (minor revision)
 - SQL-92 (major revision, current standard)
 - SQL-99 (major extensions)

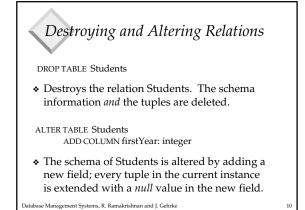

Creating Relations in SQL

- Creates the Students relation. Observe that the type (domain) of each field is specified, and enforced by the DBMS whenever tuples are added or modified.
 CREATE TABLE Students (sid: CHAR(20), name: CHAR(20), login: CHAR(10), age: INTEGER, gpa: REAL)
- As another example, the Enrolled table holds
 CREATH information about courses that students take.

CREATE TABLE Enrolled (sid: CHAR(20), cid: CHAR(20), grade: CHAR(2))

Adding and Deleting Tuples * Can insert a single tuple using: INSERT INTO Students (sid, name, login, age, gpa) VALUES (53688, 'Smith', 'smith@ee', 18, 3.2) Can delete all tuples satisfying some condition (e.g., name = Smith): DELETE FROM Students S WHERE S.name = 'Smith' Database Management Systems, R. Ramakrishnan and J. Gehrke

Integrity Constraints (ICs)

✤ IC: condition that must be true for any instance of the database; e.g., domain constraints.

11

- ICs are specified when schema is defined.
- ICs are checked when relations are modified.
- * A *legal* instance of a relation is one that satisfies all specified ICs.
 - DBMS should not allow illegal instances.
- * If the DBMS checks ICs, stored data is more faithful to real-world meaning.
 - Avoids data entry errors, too!

Primary Key Constraints

- A set of fields is a <u>key</u> for a relation if :
 1. No two distinct tuples can have same values in all key fields, and
 - 2. This is not true for any subset of the key.
 - Part 2 false? A superkey.
 - If there's >1 key for a relation, one of the keys is chosen (by DBA) to be the *primary key*.
- E.g., sid is a key for Students. (What about name?) The set {sid, gpa} is a superkey.

Database Management Systems, R. Ramakrishnan and J. Gehrke

Primary and Candidate Keys in SQL

- Possibly many <u>candidate keys</u> (specified using UNIQUE), one of which is chosen as the *primary key*.
 "For a given student and course." CREATE TABLE Enrolled
- "For a given student and course, C there is a single grade." vs.
 "Students can take only one course, and receive a single grade for that course; further, no two students in a course receive the same grade."
 - (sid CHAR(20) cid CHAR(20), grade CHAR(2), PRIMARY KEY (sid,cid)) CREATE TABLE Enrolled (sid CHAR(20), cid CHAR(20), grade CHAR(2),

PRIMARY KEY (sid),

- Used carelessly, an IC can prevent the storage of database instances that arise in practice!
- Database Management Systems, R. Ramakrishnan and J. Gehrke
- UNIQUE (cid, grade))

Foreign Keys, Referential Integrity

- <u>Foreign key</u>: Set of fields in one relation that is used to `refer' to a tuple in another relation. (Must correspond to primary key of the second relation.) Like a `logical pointer'.
- E.g. sid is a foreign key referring to Students:
 Enrolled(sid: string, cid: string, grade: string)
 - If all foreign key constraints are enforced, <u>referential</u>
 - <u>integrity</u> is achieved, i.e., no dangling references.
 Can you name a data model w/o referential integrity?
 - Links in HTML!

 Foreign Keys in SQL Only students listed in the Students relation should be allowed to enroll for courses. 						
CREATE TABLE Enrolled (sid CHAR(20), cid CHAR(20), grade CHAR(2), PRIMARY KEY (sid,cid), FOREIGN KEY (sid) REFERENCES Students)						
Enrolled sid cid grade Students						
53666 Carnatic101	C >>	sid	name	login	age	gpa
53666 Reggae203		\$ 53666	Jones	jones@cs	18	3.4
53650 Topology112	A	53688	Smith	smith@eecs	18	3.2
53666 History105	B	→ 53650	Smith	smith@math	19	3.8
Database Management Systems, R. Ramakrishnan and J. Gehrke 16						

Enforcing Referential Integrity

- Consider Students and Enrolled; sid in Enrolled is a foreign key that references Students.
- What should be done if an Enrolled tuple with a nonexistent student id is inserted? (*Reject it!*)
- What should be done if a Students tuple is deleted?
 - Also delete all Enrolled tuples that refer to it.
 - Disallow deletion of a Students tuple that is referred to.
 - Set sid in Enrolled tuples that refer to it to a *default sid*.
 - (In SQL, also: Set sid in Enrolled tuples that refer to it to a
- special value *null*, denoting `*unknown*' or `*inapplicable*'.)Similar if primary key of Students tuple is updated.

Database Management Systems, R. Ramakrishnan and J. Gehrke

Referential Integrity in SQL/92

- SQL/92 supports all 4 options on deletes and updates.
 - Default is NO ACTION (delete/update is rejected)
 - CASCADE (also delete all tuples that refer to
 - deleted tuple)
 SET NULL / SET DEFAULT
 (sets foreign key value
 of referencing tuple)
-) PRIMARY KEY (sid,cid), FOREIGN KEY (sid) REFERENCES Students ON DELETE CASCADE ON UPDATE SET DEFAULT)

CREATE TABLE Enrolled

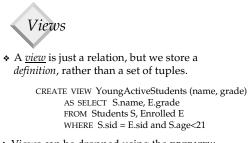

(sid CHAR(20),

cid CHAR(20),

grade CHAR(2),

Where do ICs Come From?

- ICs are based upon the semantics of the realworld enterprise that is being described in the database relations.
- We can check a database instance to see if an IC is violated, but we can NEVER infer that an IC is true by looking at an instance.
 - An IC is a statement about *all possible* instances!
 - From example, we know *name* is not a key, but the assertion that *sid* is a key is given to us.
- Key and foreign key ICs are the most common; more general ICs supported too.
 Database Management Systems, R. Ramakrishnan and J. Gehrke

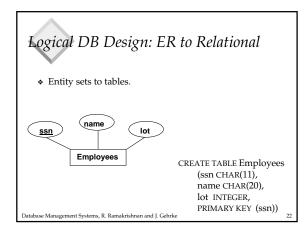

- Views can be dropped using the DROP VIEW command.
 - How to handle DROP TABLE if there's a view on the table?
 DROP TABLE command has options to let the user specify this.

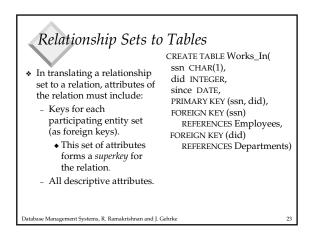

Database Management Systems, R. Ramakrishnan and J. Gehrke

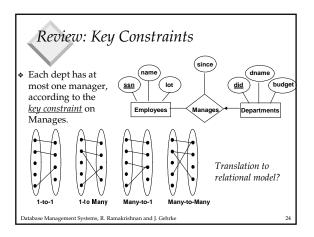

Views and Security

- Views can be used to present necessary information (or a summary), while hiding details in underlying relation(s).
 - Given YoungStudents, but not Students or Enrolled, we can find students s who have are enrolled, but not the *cid's* of the courses they are enrolled in.

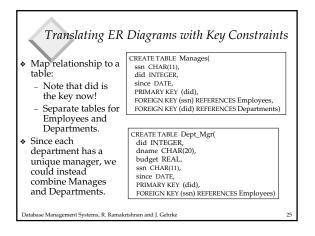

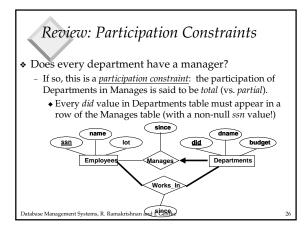

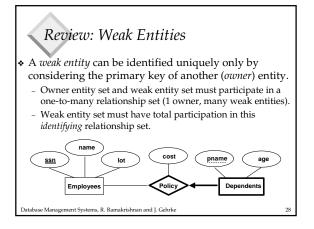

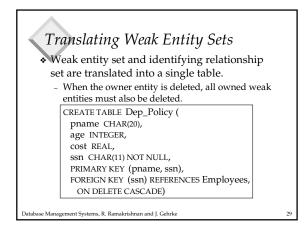

Participation Constraints in SQL

 We can capture participation constraints involving one entity set in a binary relationship, but little else (without resorting to CHECK constraints).

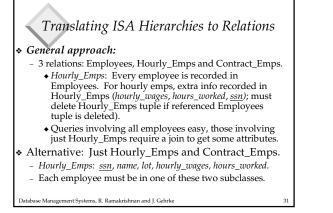

> CREATE TABLE Dept_Mgr(did INTEGER, dname CHAR(20), budget REAL, ssn CHAR(11) NOT NULL, since DATE, PRIMARY KEY (did), FOREIGN KEY (ssn) REFERENCES Employees, ON DELETE NO ACTION)

	0	Ternary Relationships (Contd.)
*	The key constraints allow us to combine Purchaser with Policies and Beneficiary with Dependents.	CREATE TABLE Policies (policyid INTEGER, cost REAL, ssn CHAR(11) NOT NULL, PRIMARY KEY (policyid). FOREIGN KEY (ssn) REFERENCES Employees, ON DELETE CASCADE)
	Participation of constraints lead to NOT NULL constraints. What if Policies is a weak entity set?	CREATE TABLE Dependents (pname CHAR(20), age INTEGER, policyid INTEGER, PRIMARY KEY (pname, policyid). FOREIGN KEY (policyid) REFERENCES Policies, ON DELETE CASCADE)
D	atabase Management Systems, R.	Ramakrishnan and J. Gehrke 33

Relational Model: Summary

- ✤ A tabular representation of data.
- Simple and intuitive, currently the most widely used.
- Integrity constraints can be specified by the DBA, based on application semantics. DBMS checks for violations.

34

- Two important ICs: primary and foreign keysIn addition, we *always* have domain constraints.
- Powerful and natural query languages exist.
- * Rules to translate ER to relational model
