

Linear Hashing

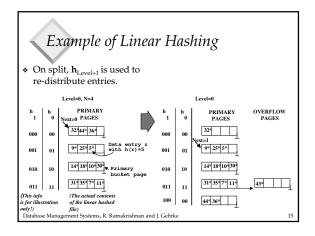

- This is another dynamic hashing scheme, an alternative to Extendible Hashing.
- LH handles the problem of long overflow chains without using a directory, and handles duplicates.
- <u>*Idea*</u>: Use a family of hash functions \mathbf{h}_{0} , \mathbf{h}_{1} , \mathbf{h}_{2} , ...
 - $\mathbf{h}_i(key) = \mathbf{h}(key) \mod(2^iN); N = initial \# buckets$
 - **h** is some hash function (range is *not* 0 to N-1)
 - If N = 2^{d0} , for some d0, \mathbf{h}_i consists of applying \mathbf{h} and looking at the last di bits, where di = d0 + i.
 - \mathbf{h}_{i+1} doubles the range of \mathbf{h}_i (similar to directory doubling)

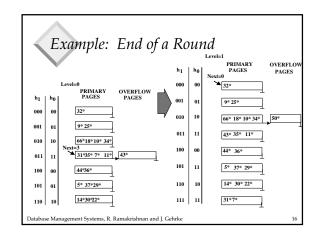

Database Management Systems, R. Ramakrishnan and J. Gehrke

Linear Hashing (Contd.) Directory avoided in LH by using overflow pages, and choosing bucket to split round-robin. Splitting proceeds in <u>rounds</u>'. Round ends when all N_R initial (for round R) buckets are split. Buckets 0 to Next-1 have been split; Next to N_R yet to be split. Current round number is Level. Search: To find bucket for data entry r, find h_{Level}(r): If h_{Level}(r) in range `Next to N_R', r belongs here. Else, r could belong to bucket h_{Level+1}(r) to find out.

LH Described as a Variant of EH

- The two schemes are actually quite similar:
 - Begin with an EH index where directory has N elements.
 - Use overflow pages, split buckets round-robin.
 - First split is at bucket 0. (Imagine directory being doubled at this point.) But elements <1,N+1>, <2,N+2>, ... are the same. So, need only create directory element *N*, which differs from 0, now.
 - ◆ When bucket 1 splits, create directory element *N*+1, etc.
- So, directory can double gradually. Also, primary bucket pages are created in order. If they are *allocated* in sequence too (so that finding i'th is easy), we actually don't need a directory! Voila, LH.
 Database Management Systems, R. Ramakrishnan and J. Gehter

Summary

- Hash-based indexes: best for equality searches, cannot support range searches.
- * Static Hashing can lead to long overflow chains.
- Extendible Hashing avoids overflow pages by splitting a full bucket when a new data entry is to be added to it. (*Duplicates may require overflow pages.*)
 - Directory to keep track of buckets, doubles periodically.Can get large with skewed data; additional I/O if this
 - does not fit in main memory.

Database Management Systems, R. Ramakrishnan and J. Gehrke

Summary (Contd.)

- Linear Hashing avoids directory by splitting buckets round-robin, and using overflow pages.
 - Overflow pages not likely to be long.
 - Duplicates handled easily.
 - Space utilization could be lower than Extendible Hashing, since splits not concentrated on `dense' data areas.
 - Can tune criterion for triggering splits to trade-off slightly longer chains for better space utilization.
- For hash-based indexes, a *skewed* data distribution is one in which the *hash values* of data entries are not uniformly distributed!
