

Why Not Store Everything in Main Memory?
Costs too much. \$500 will buy you either 512MB of RAM or 100GB of disk today.
Main memory is volatile. We want data to be saved between runs. (Obviously!)

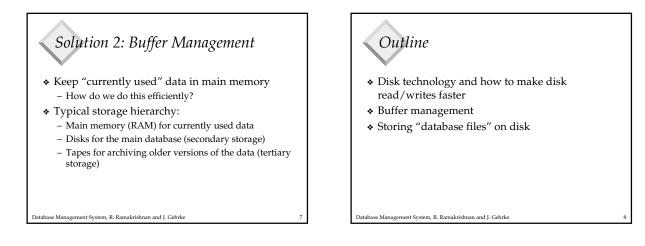

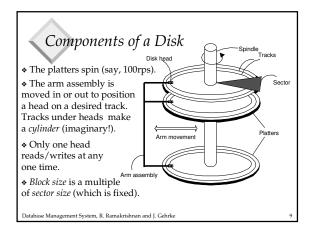

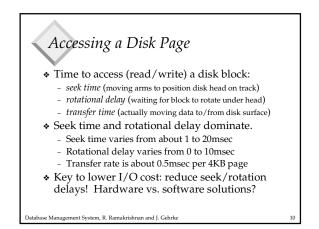

Intelligent data layout on disk
 Put related data items together

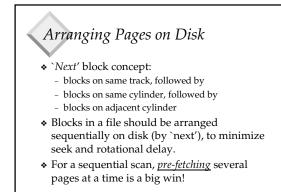

Database Management System, R. Ramakrishnan and J. Gehrke

Redundant Array of Inexpensive Disks (RAID)
 Achieve parallelism by using many disks

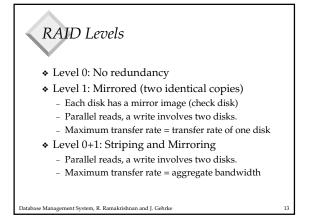

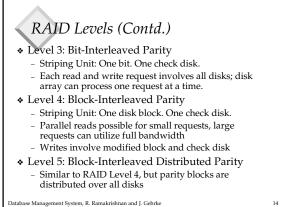

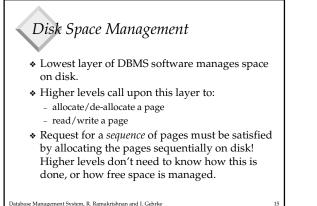

Database Management System, R. Ramakrishnan and J. Gehrke

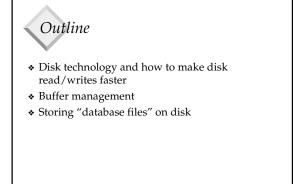

RAID
Disk Array: Arrangement of several disks that gives abstraction of a single, large disk.
Goals: Increase performance and reliability.
Two main techniques:

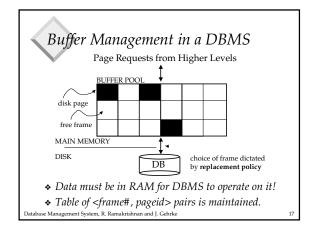

Data striping: Data is partitioned; size of a partition is called the striping unit. Partitions are distributed over several disks.
Redundancy: More disks -> more failures. Redundant information allows reconstruction of data if a disk fails.

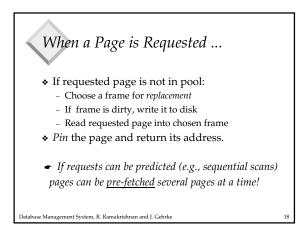

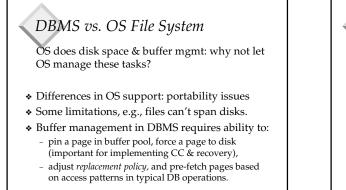

More on Buffer Management

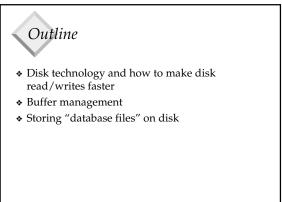

- Requestor of page must unpin it, and indicate whether page has been modified:
 dirty bit is used for this.
- Page in pool may be requested many times,
 a *pin count* is used. A page is a candidate for replacement iff *pin count* = 0.
- CC & recovery may entail additional I/O when a frame is chosen for replacement. (Write-Ahead Log protocol; more later.)

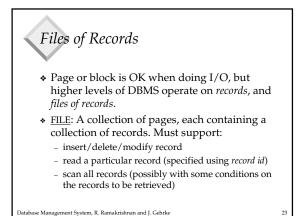

Database Management System, R. Ramakrishnan and J. Gehrke

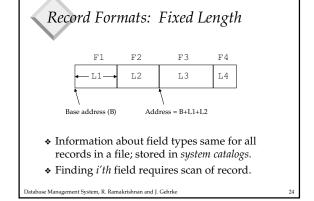

Database Management System, R. Ramakrishnan and J. Gehrke

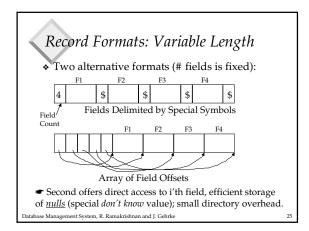

Buffer Replacement Policy
Frame is chosen for replacement by a *replacement policy:*Least-recently-used (LRU), Clock, MRU etc.
Policy can have big impact on # of I/O's; depends on the *access pattern*.
<u>Sequential flooding</u>: Nasty situation caused by LRU + repeated sequential scans.
buffer frames < # pages in file means each page request causes an I/O. MRU much better in this situation (but not in all situations, of course).

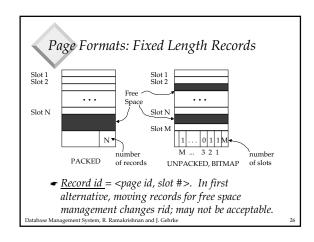

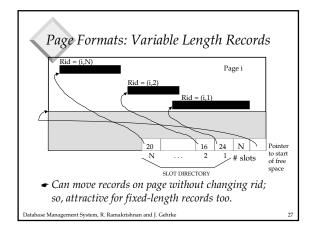

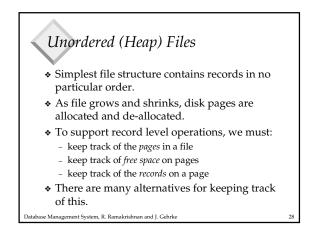

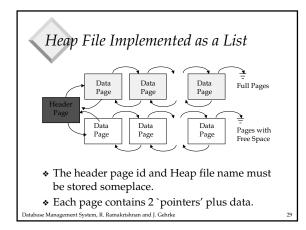

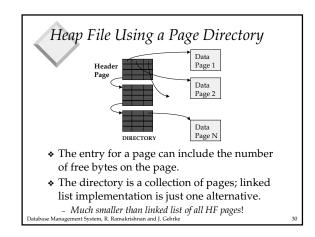

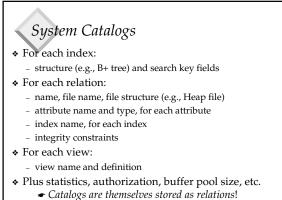

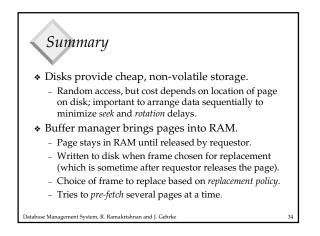

- A Heap file allows us to retrieve records:
 by specifying the *rid*, or
 - by scanning all records sequentially
- Sometimes, we want to retrieve records by specifying the values in one or more fields, e.g.,
 - Find all students in the "CS" department
 - Find all students with a gpa > 3
- <u>Indexes</u> are file structures that enable us to answer such value-based queries efficiently.

g	pa	Students	real	5	
	id	Faculty	string	1	
fi	name	Faculty	string	2	
s	al	Faculty	real	3	

- * DBMS vs. OS File Support
 - DBMS needs features not found in many OS's, e.g., forcing a page to disk, controlling the order of page writes to disk, files spanning disks, ability to control pre-fetching and page replacement policy based on predictable access patterns, etc.
- Variable length record format with field offset directory offers support for direct access to i'th field and null values.
- Slotted page format supports variable length records and allows records to move on page.
 Database Management System, R. Ramakrishnan and J. Gehrke

- based on the values in some fields.
- Catalog relations store information about relations, indexes and views. (Information that is common to all records in a given collection.)
