The Relational Model

Ramakrishnan&Gehrke, Chapter 3

CS432 Fall 2007

Why Study the Relational Model?

- * Most widely used model.
 - Vendors: IBM, Informix, Microsoft, Oracle, Sybase, etc.
- "Legacy systems" in older models
 - E.G., IBM's IMS
- * Recent competitor: object-oriented model
 - ObjectStore, Versant, Ontos
 - A synthesis emerging: object-relational model
 - Informix Universal Server, UniSQL, O2, Oracle, DB2

CS432 Fall 2007

Relational Database: Definitions

- * Relational database: a set of relations
- * *Relation:* made up of 2 parts:
 - Instance: a table, with rows and columns.
 #Rows = cardinality, #fields = degree / arity.
 - Schema: specifies name of relation, plus name and type of each column.
 - E.G. Students(sid: string, name: string, login: string, age: integer, gpa: real).
- Can think of a relation as a set of rows or tuples (i.e., all rows are distinct).

Example Instance of Students Relation

sid	name	login	age	gpa
53666	Jones	jones@cs	18	3.4
53688	Smith	smith@eecs	18	3.2
53650	Smith	smith@math	19	3.8

- ❖ Cardinality = 3, degree = 5, all rows distinct
- Do all columns in a relation instance have to be distinct?

C422 E-II 2005

Relational Query Languages

- * A major strength of the relational model: supports simple, powerful *querying* of data.
- * Queries can be written intuitively, and the DBMS is responsible for efficient evaluation.
 - The key: precise semantics for relational queries.
 - Allows the optimizer to extensively re-order operations, and still ensure that the answer does not change.

CS432 Fall 2007

The SQL Query Language

- ❖ Developed by IBM (system R) in the 1970s
- Need for a standard since it is used by many vendors
- ❖ Standards:
 - SQL-86
 - SQL-89 (minor revision)
 - SQL-92 (major revision)
 - SQL-99 (major extensions, current standard)

S432 Fall 2007

-		

The SQL Query Language

* To find all 18 year old students, we can write:

FROM Students S WHERE S.age=18

sid	name	login	age	gpa
	-	jones@cs		
53688	Smith	smith@ee	18	3.2

•To find just names and logins, replace the first line: SELECT S.name, S.login

CS432 Fall 2007

Querying Multiple Relations

* What does the following query compute?

SELECT S.name, E.cid FROM Students S, Enrolled E WHERE S.sid=E.sid AND E.grade="A"

Given the following instances of Enrolled and Students:

sid	name	login	age	gpa
53666	Jones	jones@cs	18	3.4
53688	Smith	smith@eecs	18	3.2
53650	Smith	smith@math	19	3.8

sid	cid	grade
53831	Carnatic101	С
53831	Reggae203	В
53650	Topology112	Α
53666	History 105	В

we get:

1	S.name	E.cid
S	mith	Topology112

CS432 Fall 2007

Creating Relations in SQL

- Creates the Students relation. Observe that the type (domain) of each field is specified, and enforced by the DBMS whenever tuples are added or modified.
- As another example, the Enrolled table holds information about courses that students take.

CREATE TABLE Students (sid: CHAR(20),

CR

name: CHAR(20), login: CHAR(10), age: INTEGER, gpa: REAL)	
EATE TABLE Enrolled	
(sid: CHAR(20), cid: CHAR(20),	
grade: CHAR(2))	

Destroying and Altering Relations

DROP TABLE Students

 Destroys the relation Students. The schema information and the tuples are deleted.

ALTER TABLE Students
ADD COLUMN firstYear: integer

The schema of Students is altered by adding a new field; every tuple in the current instance is extended with a *null* value in the new field.

CS432 Fall 2007

10

Adding and Deleting Tuples

* Can insert a single tuple using:

INSERT INTO Students (sid, name, login, age, gpa) VALUES (53688, 'Smith', 'smith@ee', 18, 3.2)

Can delete all tuples satisfying some condition (e.g., name = Smith):

> DELETE FROM Students S WHERE S.name = 'Smith'

* Powerful variants of these commands are available; more later! CS432 Fall 2007

11

Integrity Constraints (ICs)

- * IC: condition that must be true for *any* instance of the database; e.g., *domain constraints*.
 - ICs are specified when schema is defined.
 - ICs are checked when relations are modified.
- * A *legal* instance of a relation is one that satisfies all specified ICs.
 - DBMS should not allow illegal instances.
- If the DBMS checks ICs, stored data is more faithful to real-world meaning.
 - Avoids data entry errors, too!

S432 Fall 2007

J		
ļ		
J		

Primary Key Constraints

- * A set of fields is a **key** for a relation if:
 - $1. \ No \ two \ distinct \ tuples \ can \ have \ same \ values \ in \ all \ key \ fields, \ and$
 - 2. This is not true for any subset of the key.
 - Part 2 false? A superkey.
 - If there's >1 key for a relation, one of the keys is chosen (by DBA) to be the *primary key*.
- * E.g., *sid* is a key for Students. (What about *name*?) The set {*sid*, *gpa*} is a superkey.

CS432 Fall 2007

13

Primary and Candidate Keys in SQL

- Possibly many <u>candidate keys</u> (specified using <u>UNIQUE</u>), one of which is chosen as the <u>primary key</u>.
- "For a given student and course, there is a single grade." vs. "Students can take only one course, and receive a single grade for that course; further, no two students in a course receive the same grade."
- Used carelessly, an IC can prevent the storage of database instances that arise in practice!

CS432 Fall 2007

CREATE TABLE Enrolled
(sid CHAR(20)
cid CHAR(20),
grade CHAR(2),
PRIMARY KEY (sid,cid))
CREATE TABLE Enrolled
(sid CHAR(20)
cid CHAR(20),
grade CHAR(2),
PRIMARY KEY (sid),

UNIQUE (cid, grade))

1.4

Foreign Keys, Referential Integrity

- * Foreign key: Set of fields in one relation that is used to `refer' to a tuple in another relation. (Must correspond to primary key of the second relation.) Like a `logical pointer'.
- * E.g. *sid* is a foreign key referring to **Students**:
 - Enrolled(sid: string, cid: string, grade: string)
 - If all foreign key constraints are enforced, <u>referential</u> <u>integrity</u> is achieved, i.e., no dangling references.
 - Can you name a data model w/o referential integrity?
 Links in HTML!

CS432 Fall 2007

_		

Foreign Keys in SQL

 Only students listed in the Students relation should be allowed to enroll for courses.

CREATE TABLE Enrolled
(sid CHAR(20), cid CHAR(20), grade CHAR(2),
PRIMARY KEY (sid,cid),
FOREIGN KEY (sid) REFERENCES Students)

Enrolled

sid	cid	grade		Stude	ents			
53666	Carnatic101	C -		sid	name	login	age	gpa
	Reggae203	В -		53666	Jones	jones@cs	18	3.4
	Topology112	Α -		53688	Smith	smith@eecs	18	3.2
	History 105	B	\rightarrow	53650	Smith	smith@math	19	3.8
			J					

Enforcing Referential Integrity

- Consider Students and Enrolled; sid in Enrolled is a foreign key that references Students.
- What should be done if an Enrolled tuple with a non-existent student id is inserted? (Reject it!)
- What should be done if a Students tuple is deleted?
 - Also delete all Enrolled tuples that refer to it.
 - Disallow deletion of a Students tuple that is referred to.
 - Set sid in Enrolled tuples that refer to it to a *default sid*.
 - (In SQL, also: Set sid in Enrolled tuples that refer to it to a special value null, denoting `unknown' or `inapplicable'.)
- * Similar if primary key of Students tuple is updated.

CS432 Fall 2007 17

Referential Integrity in SQL

- SQL/92 and SQL:1999 support all 4 options on deletes and updates.
 - Default is **NO ACTION** (*delete/update is rejected*)
 - CASCADE (also delete all tuples that refer to deleted tuple)
 - SET NULL / SET DEFAULT (sets foreign key value of referencing tuple)

CREATE TABLE Enrolled
(sid CHAR(20),
cid CHAR(20),
grade CHAR(2),
PRIMARY KEY (sid,cid),
FOREIGN KEY (sid)
REFERENCES Students
ON DELETE CASCADE
ON UPDATE SET DEFAULT)

2422 F. H 2007

Where do ICs Come From?

- ICs are based upon the semantics of the realworld enterprise that is being described in the database relations.
- We can check a database instance to see if an IC is violated, but we can NEVER infer that an IC is true by looking at an instance.
 - An IC is a statement about all possible instances!
 - From example, we know *name* is not a key, but the assertion that *sid* is a key is given to us.
- * Key and foreign key ICs are the most common; more general ICs supported too.

CS432 Fall 2003

19

Logical DB Design: ER to Relational

* Entity sets to tables:

CREATE TABLE Employees (ssn CHAR(11), name CHAR(20), lot INTEGER, PRIMARY KEY (ssn))

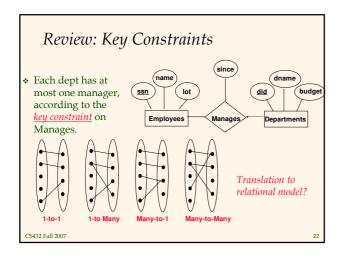

CS432 Fall 2007

20

Relationship Sets to Tables

- In translating a relationship set to a relation, attributes of the relation must include:
 - Keys for each participating entity set (as foreign keys).
 - This set of attributes forms a *superkey* for the relation.
 - All descriptive attributes.

CREATE TABLE Works_In(
ssn CHAR(11),
did INTEGER,
since DATE,
PRIMARY KEY (ssn, did),
FOREIGN KEY (ssn)
REFERENCES Employees,
FOREIGN KEY (did)
REFERENCES Departments)

Translating ER Diagrams with Key Constraints CREATE TABLE Manages(Map relationship to a table: ssn CHAR(11), did INTEGER, since DATE, PRIMARY KEY (did), FOREIGN KEY (ssn) REFERENCES Employees, FOREIGN KEY (did) REFERENCES Departments) • Note that did is the key now! Separate tables for Employees and Departments. CREATE TABLE Dept_Mgr(did INTEGER, dname CHAR(20), budget REAL, ssn CHAR(11), Since each department has a unique manager, we could instead since DATE, PRIMARY KEY (did), combine Manages

FOREIGN KEY (ssn) REFERENCES Employees)

and Departments.

CS432 Fall 2007

CS432 Fall 2007

since

Participation Constraints in SQL

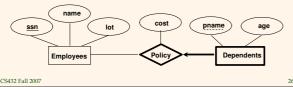

* We can capture participation constraints involving one entity set in a binary relationship, but little else (without resorting to CHECK constraints).

```
CREATE TABLE Dept_Mgr(
did INTEGER,
dname CHAR(20),
budget REAL,
ssn CHAR(11) NOT NULL,
since DATE,
PRIMARY KEY (did),
FOREIGN KEY (ssn) REFERENCES Employees,
ON DELETE NO ACTION)
```

CS432 Fall 2007

Review: Weak Entities

- * A *weak entity* can be identified uniquely only by considering the primary key of another (*owner*) entity.
 - Owner entity set and weak entity set must participate in a one-to-many relationship set (1 owner, many weak entities).
 - Weak entity set must have total participation in this *identifying* relationship set.

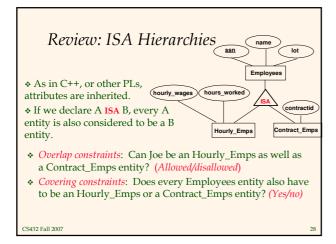

Translating Weak Entity Sets

- Weak entity set and identifying relationship set are translated into a single table.
 - When the owner entity is deleted, all owned weak entities must also be deleted.

CREATE TABLE Dep_Policy (
pname CHAR(20),
age INTEGER,
cost REAL,
ssn CHAR(11) NOT NULL,
PRIMARY KEY (pname, ssn),
FOREIGN KEY (ssn) REFERENCES Employees,
ON DELETE CASCADE)

CS432 Fall 2007

•		
•		
•		

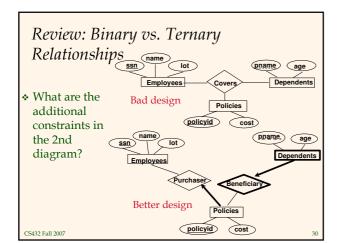

Translating ISA Hierarchies to Relations

* General approach:

- 3 relations: Employees, Hourly_Emps and Contract_Emps.
 - *Hourly_Emps*: Every employee is recorded in Employees. For hourly emps, extra info recorded in Hourly_Emps (*hourly_wages*, *hours_worked*, *ssn*); must delete Hourly_Emps tuple if referenced Employees tuple is deleted).
 - Queries involving all employees easy, those involving just Hourly_Emps require a join to get some attributes.
- Alternative: Just Hourly_Emps and Contract_Emps.
 - Hourly_Emps: <u>ssn</u>, name, lot, hourly_wages, hours_worked.
 - Each employee must be in one of these two subclasses.

CS432 Fall 2007

Binary vs. Ternary Relationships (Contd.) CREATE TABLE Policies (The key policyid INTEGER, constraints allow cost REAL. us to combine ssn CHAR(11) NOT NULL, Purchaser with PRIMARY KEY (policyid). Policies and FOREIGN KEY (ssn) REFERENCES Employees, Beneficiary with ON DELETE CASCADE) Dependents. Participation CREATE TABLE Dependents (constraints lead to pname CHAR(20), age INTEGER, constraints. policyid INTEGER, * What if Policies is PRIMARY KEY (pname, policyid). a weak entity set? FOREIGN KEY (policyid) REFERENCES Policies ON DELETE CASCADE) CS432 Fall 2007 Views * A *view* is just a relation, but we store a definition, rather than a set of tuples. CREATE VIEW YoungActiveStudents (name, grade) AS SELECT S.name, E.grade FROM Students S, Enrolled E WHERE S.sid = E.sid and S.age<21 * Views can be dropped using the **DROP VIEW** command. • How to handle **DROP TABLE** if there's a view on the table? • DROP TABLE command has options to let the user specify this. CS432 Fall 2007 Views and Security * Views can be used to present necessary information (or a summary), while hiding details in underlying relation(s). • Given YoungStudents, but not Students or Enrolled, we can find students s who have are

32 Fall 2007

enrolled in.

enrolled, but not the cid's of the courses they are

Relational Model: Summary

- * A tabular representation of data.
- * Simple and intuitive, currently the most widely used.
- Integrity constraints can be specified by the DBA, based on application semantics. DBMS checks for violations.
 - Two important ICs: primary and foreign keys
 - In addition, we *always* have domain constraints.
- Powerful and natural query languages exist.
- * Rules to translate ER to relational model

CS432 Fall 2007
