

CS4410 Homework 1

This material is property of the Cornell CS4410 course staff. You are not allowed to share this material unless the Cornell CS4410 course staff has granted explicit permission.

To view and fill out this PDF, we recommend using Adobe Acrobat or Apple Preview. Other PDF browsers we tried do not always produce correctly filled PDF forms. Make sure you do not “flatten” the PDF (export to PDF, print to PDF), but submit a saved form that is still editable, otherwise our autograder will not be able to extract your answers.

==== Questions ====

Generated for *somebody*

Due Saturday, January 27th, 11:59pm (but check CMSX always)

| Question | #Points | Percentage |
|-----------------------------|---------|------------|
| 1. Tell Us About Yourself | 6 | 11.1% |
| 2. Practice Your Arithmetic | 32 | 59.3% |
| 3. Multiple Choice | 16 | 29.6% |
| Total | 54 | 100.0% |

Question 1: Tell Us About Yourself (6 points)

- (1.1) What is your NetID?
- (1.2) What are your preferred pronouns?
- (1.3) Tell us a bit more about yourself in a few lines?

Somebody

Question 2: Practice Your Arithmetic (32 points)

Answer the following questions. This homework will not count for much, so answer the questions by yourself for practice. Try to do them without a calculator—you won't have access to one at an exam.

Question 2.1: first exercise (16 points)

- (2.1.1) What is $2^0 \times 2^3$? Only provide the exponent.
- (2.1.2) What is the binary number 00011001000011 in hexadecimal?
- (2.1.3) What is 2^{26} in hexadecimal?
- (2.1.4) What is $2^{30} - 1$ in hexadecimal?
- (2.1.5) If a computer has 39 address lines, what is the maximal byte address in hexadecimal?
- (2.1.6) If the stack pointer is 0xFFFF59200 and the computer pushes 4 4-byte words onto the stack (which is growing down), what is the resulting stack pointer in hexadecimal?
- (2.1.7) How many 2048-byte blocks are there on a 1TB disk in 2^x notation? (Provide only the exponent.)
- (2.1.8) What is 10001001 XOR 11010010 in binary?

Question 2.2: another exercise (16 points)

- (2.2.1) What is $2^6 \times 2^4$? Only provide the exponent.
- (2.2.2) What is the binary number 11100011101000 in hexadecimal?
- (2.2.3) What is 2^{25} in hexadecimal?
- (2.2.4) What is $2^{20} - 1$ in hexadecimal?
- (2.2.5) If a computer has 38 address lines, what is the maximal byte address in hexadecimal?
- (2.2.6) If the stack pointer is 0xFFFFB5C90 and the computer pushes 3 4-byte words onto the stack (which is growing down), what is the resulting stack pointer in hexadecimal?
- (2.2.7) How many 1024-byte blocks are there on a 16TB disk in 2^x notation? (Provide only the exponent.)
- (2.2.8) What is 11111010 XOR 01101101 in binary?

Question 3: Multiple Choice (16 points)

Review the material in <https://www.cs.cornell.edu/courses/cs4410/2024sp/resources/background.pdf>. Then answer the following questions. For each question, check *one* of the boxes. These are randomized—do not be concerned if you see unlikely patterns.

(3.1) Which of the following statements is *correct*?

Divide-by-zero is an example of an asynchronous, maskable signal.

On an x86 processor, when you push a value onto the stack, the stack pointer is decremented.

For efficiency, different cores of the same CPU can access each other's registers.

(3.2) Which of the following statements is *correct*?

Using a computer's LOAD and STORE machine instructions, it is possible to directly read and write words on a disk in much the same way as words in RAM.

"Direct Memory Access" (DMA) means that devices can directly access the RAM of a computer.

A disk controller is a program that controls access to a disk.

(3.3) Which of the following statements is *wrong*?

Each register of a CPU has its own memory address.

The "stack" of a computer is important for keeping track of the control flow of a computer program.

The "heap" of a computer is where data objects are allocated dynamically.

(3.4) Which of the following statements is *wrong*?

In 2's complement encoding of an 8-bit integer, -128 is the minimum value.

ASCII encoding uses 16 bits per character.

There are 4 bits in a hexadecimal digit.
