

## Lecture 14: Many Lights

**CS 6620, Spring 2009**

**Kavita Bala**

Computer Science

Cornell University

### Why Shadows?

---

- Crucial for spatial and depth perception

© Kavita Bala, Computer Science, Cornell University

# Shadows

---

Methods for fast shadows:

- Shadow Maps
- Shadow Volumes

© Kavita Bala, Computer Science, Cornell University

# Shadow Maps

---

- Introduced by Lance Williams (SIGGRAPH 1978)
- Render scene from light's view
  - black is far, white is close

© Kavita Bala, Computer Science, Cornell University

## Using the Shadow Map

- When scene is viewed, check viewed location in light's shadow buffer
  - If point's depth is greater than shadow depth, object is in shadow

© Kavita Bala, Computer Science, Cornell University

## Shadow Mapping: Pass 1

- Depth testing from light's point-of-view
  - Two pass algorithm
- First, render depth buffer from light's point-of-view
  - Result is a “depth map” or “shadow map”
  - A 2D function indicating the depth of the closest pixels to the light
  - This depth map is used in the second pass

© Kavita Bala, Computer Science, Cornell University

## Shadow Mapping: 2<sup>nd</sup> pass

---

- Second, render scene from the eye's point-of-view

© Kavita Bala, Computer Science, Cornell University

## Shadow Mapping: Comparison

---

- For each rasterized fragment
- Two values
  - $A = Z$  value from depth map at fragment's light XY position
  - $B = Z$  value of fragment's XYZ light position
- If ( $B > A$ ),
  - There must be something closer to the light than the fragment
  - So, fragment is shadowed
- If  $A$  and  $B$  are approximately equal, the fragment is lit

© Kavita Bala, Computer Science, Cornell University

## Example: Shadowed

The  $A < B$  shadowed fragment case

© Kavita Bala, Computer Science, Cornell University

## Example: Visible

© Kavita Bala, Computer Science, Cornell University

# Example

---

© Kavita Bala, Computer Science, Cornell University

# Example

---

***with shadows***

***without shadows***

© Kavita Bala, Computer Science, Cornell University

## Shadow Map Issues

---

- Get speckling. Why?
- Use triangle Ids? Object ids?
  - Meshes?
- Bias:  $b$ 
  - If  $(p.z < SM(x,y)+b)$   $p$  in shadow
    - Where  $(x,y)$  is the position in SM to which the point  $p$  projects
  - If  $b$  is large, could get light where it is shadowed
  - If  $b$  is small, could get speckling

© Kavita Bala, Computer Science, Cornell University

## Bias Issues

---

- How much polygon offset bias depends

*Too little bias,  
speckling*

*Too much bias, shadow  
starts too far back*

*Just right*

© Kavita Bala, Computer Science, Cornell University

## Shadow Map Issues

---

- Can only cast shadows over a frustum
  - Use 6 (like a cube map)

© Kavita Bala, Computer Science, Cornell University

## Aliasing (Distant)

---

© Kavita Bala, Computer Science, Cornell University

## Aliasing in Eye View (Distant)

---

© Kavita Bala, Computer Science, Cornell University

## Aliasing (Close)

---

© Kavita Bala, Computer Science, Cornell University

# Why does Aliasing arise?

Eye View

Shadow Map

Eye View Projected Area  $\neq$  Shadow Map Projected Area

© Kavita Bala, Computer Science, Cornell University

# Where does aliasing occur?

Fully Lit

Fully Occluded

Shadow Boundary (Adequate Resolution)

Shadow Boundary (Inadequate Resolution)

© Kavita Bala, Computer Science, Cornell University

## Handle Aliasing

---

- Adaptive Shadow Maps
  - Fernando, Fernandez, Bala, Greenberg [SIG01]
- Perspective Shadow Maps
  - Stamminger, Drettakis
- Many, many variants

© Kavita Bala, Computer Science, Cornell University

## Implementation Issues

---

- Shadow maps are dominating
- Hardware support for them
- Remember, hardware does perspective-correct texturing
- Shadowmaps use projective texturing

© Kavita Bala, Computer Science, Cornell University

## Soft Shadows

---

- Soft shadows appear more natural
  - Hard to get soft shadows in hardware
- MANY systems that try to approximate soft shadows

© Kavita Bala, Computer Science, Cornell University

## Soft Shadows

---

- Soft shadows appear more natural
  - Hard to get soft shadows in hardware

© Kavita Bala, Computer Science, Cornell University

## Heckbert and Herf

---

- Use accumulation buffer
- Render shadows from multiple point lights over the area light
- Accumulate shadows

© Kavita Bala, Computer Science, Cornell University

## Soft Shadows: Heckbert/Herf

---

2 x 2 samples

average

16 x 16 samples

Images courtesy of Michael Herf and Paul Heckbert

© Kavita Bala, Computer Science, Cornell University

## Heckbert/Herf Soft Shadows

---

- Advantage: gives true penumbra
- Limitations: overlapping shadows are unconvincing unless a lot of passes are made

Images courtesy of Michael Herf and Paul Heckbert

© Kavita Bala, Computer Science, Cornell University

## Summary

---

- Shadow maps
  - User projective texturing: requires hardware support/shaders
  - Pros: simple, fast
  - Cons: Aliasing, Bias, Hard shadows
  - One shadow map per light
  - Render scene twice per frame
    - If static, can reuse
- Soft shadows
  - Use accumulation buffers

© Kavita Bala, Computer Science, Cornell University

## Instant radiosity

---

- Interesting hack:
  - Bounce ‘photons’ from light sources
    - Same as first pass from photon mapping
  - Have *point lights* at bounces!
  - Do cheap rendering using
    - Fast ray tracing or graphics hardware (using SM)

© Kavita Bala, Computer Science, Cornell University

## Instant radiosity demo

---

- Point lights on the light source

## Instant radiosity demo

---

- Direct illumination

Average of  
previous 10  
renders

## Instant radiosity demo

---

- Point lights one 'bounce' into scene

## Instant radiosity demo

---

- Radiosity

Average of  
previous 10  
renders

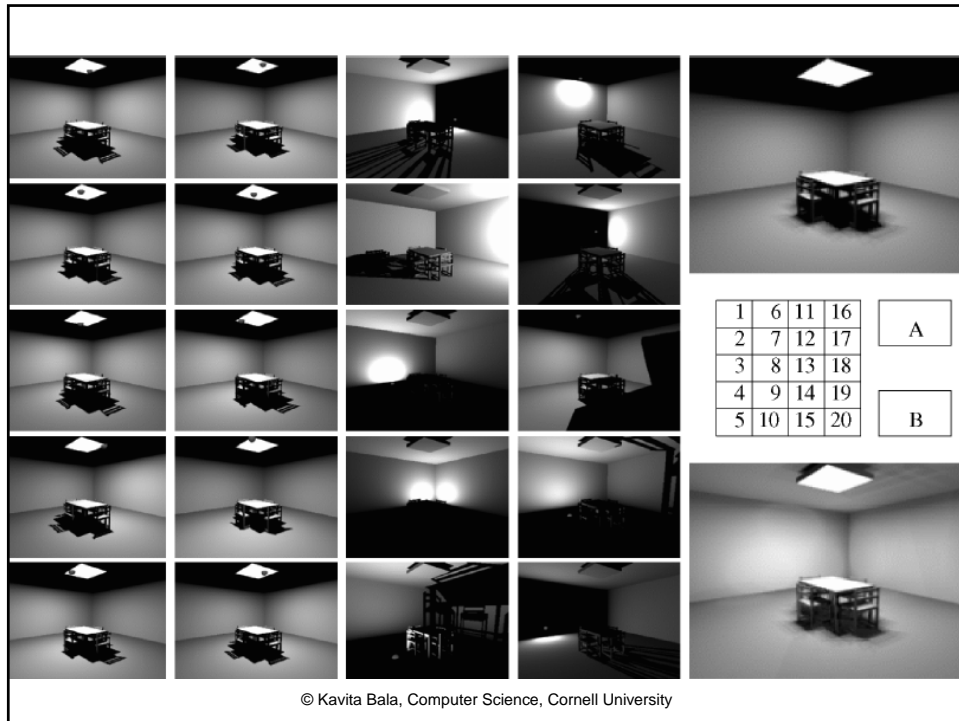

## Instant radiosity demo

---

- Result

Instant  
radiosity

## The Problem: Diffuse Scene

---

Path tracer  
272 seconds  
(Core 2 Duo, 2 threads)

**no clamping**

© Kavita Bala, Computer Science, Cornell University

## How Much is Missing?

DIFF

Kavita Bala, Computer Science, Cornell University

## The Bigger Problem: Glossy Scene

Path tracer  
569 seconds  
(Core 2 Duo, 2 threads)

**no clamping**

© Kavita Bala, Computer Science, Cornell University

## How Much is Missing?

---

## Advantage

---

- Point lights are placed randomly
- But the same set of lights for each pixel
  - Still Monte Carlo, but samples are *positively correlated*
- This means less noise
  - But maybe banding
- Disadvantage
  - Clamping!

© Kavita Bala, Computer Science, Cornell University

## Many Lights

---

- Most techniques work for a single light source
- Many light sources
  - For environment maps
  - For indirect illumination
- Treat it is a single integration domain
  - Importance sample lights
  - Importance sampling (with visibility) still hard problem

© Kavita Bala, Computer Science, Cornell University

## Research on many lights

---

- Ward '91
- Shirley, Wang, Zimmerman '94
- Fernandez, Bala, Greenberg '02
  - Donikian, Fernandez.. '06
- Lightcuts '05

© Kavita Bala, Computer Science, Cornell University

## Shirley, Wang, Zimmerman '94

---

- Try to avoid linear cost of evaluating lights
- Separate lights into
  - Set of important lights (a small set)
  - Set of “dim” lights (large set)
- Construct pdf using:
  - all important lights
  - 1 out of all the dim lights
- Importance sample these lights

© Kavita Bala, Computer Science, Cornell University

## Shirley, Wang, Zimmerman '94

---

- Region of influence for important lights
  - Octree cells in region of influence have light in important set
- However, the partitioning into important and dim sets remains hard
- Also, still are not taking visibility into account

© Kavita Bala, Computer Science, Cornell University
