

Repetition Statements (Loops)

CS 99 – Summer 2000
Michael Clarkson
Lecture 5

Administration

- Prelim 1 Review Session Tonight
 - 7:30-8:30pm
 - Upson 211
 - Bring questions or it will be over quickly!
- Lab 4 in progress, due tomorrow
- Lab 5 posted today
- Prelim 1 on Wednesday in class, covers:
 - Lectures & Labs 1-4
 - assigned reading (esp. 1.2, 1.4, 1.5, 2.2, 2.4)

Agenda

- Repetition statements
- Three repetitions statements in Java:
 - for
 - while
 - do

Repetition

- Computers are great at performing repeated tasks
- So far, we don't know how to repeat tasks (conveniently) in a program
- Examples:
 - Add all the integers from 1 to 100
 - Calculate grades for an entire class

Repetition [2]

- The three statements for repetition in Java are:

```
for(;;) {  
    ...  
}  
while(;;) {  
    ...  
}  
do {  
    ...  
} while(;;);
```

- Most loops share these characteristics:
 - a variable is assigned some value before the loop
 - the variable's value changes at some point in the loop
 - repetition continues until some condition is true (e.g., the variable reaches some predetermined value)

Repetition [3]

- Pretest loop: a loop that uses a condition to control whether or not the body of the loop is executed *before* going through the loop
 - condition is true, body is executed
 - condition is false, body is skipped
 - while, for
- Posttest loop: executes the body of the loop, then checks a condition to decide whether to execute it again
 - condition is true, body is executed again, and condition checked again
 - condition is false, move on to next executable statement
 - do

Repetition [4]

- Variable repetition: the number of times the loop body will execute is unknown
 - e.g., adding numbers the user enters until the sum is greater than 100
 - `while`, `do`
- Fixed repetition: the number of times the loop body will execute is predetermined (but not nec. constant)
 - e.g., adding integers from 1 to 100
 - `for`, (`while`, `do`)

7/10/00

CS 99 • Summer 2000 • Michael Clarkson • Lecture 5

7

Repetition [5]

- `while`, `do`, and `for` loops are all equivalent in that each can be rewritten as the others
 - though it may require the addition of one or more statements
- However, each loop is more appropriate at different times, based on whether you want fixed or variable repetition, and pretests or posttests

7/10/00

CS 99 • Summer 2000 • Michael Clarkson • Lecture 5

8

for Loops

- The `for` loop is:
 - pretest
 - fixed repetition
 - A convenient structure for writing certain types of loops more concisely than `while` allows
- It combines 3 statements into one

7/10/00

CS 99 • Summer 2000 • Michael Clarkson • Lecture 5

9

First for

```
// sum the integers from 1 to 100
sum = 0;
for (i = 1; i <= 100; i++) {
    sum = sum + i;
}
```

- Execution:
 - Initialize `i` to 1
 - Check if `i` is less than or equal to 100
 - If so, execute body
 - If not, stop repeating
 - Update `i` by incrementing it
 - Repeat

7/10/00

CS 99 • Summer 2000 • Michael Clarkson • Lecture 5

10

Syntax of for

```
for (initializer; condition; update) {
    ...
}
```

- *initializer* and *update* are statements
 - *initializer* can be a variable declaration, with scope through the end of the block that the `for` statement is in
- *condition* is a boolean expression
- the first line is called the *loop header*

7/10/00

CS 99 • Summer 2000 • Michael Clarkson • Lecture 5

11

Control Flow of for

7/10/00

CS 99 • Summer 2000 • Michael Clarkson • Lecture 5

12

Common for loops

```
// count from low to high using var
for (int var = low; var <= high; var++) {
    ...
}

// count from high down to low using var
for (int var = high; var >= low; var--) {
    ...
}
```

These types of for loops should never change the value of *var* inside of the body!

7/10/00

CS 99 • Summer 2000 • Michael Clarkson • Lecture 5

13

for Example #1

- Print the numbers 1-10 along with their squares and cubes

```
for (int i = 1; i <= 10; i++) {
    System.out.println(i + "\t" + i*i + "\t" +
        i*i*i);
}
```

7/10/00

CS 99 • Summer 2000 • Michael Clarkson • Lecture 5

14

for Example #2

- Average a set of numbers entered by the user. Begin by inputting how many numbers are in the set.

```
System.out.print("Enter how many numbers there are: ");
int size = Console.readInt();
int sum = 0;
for (int i = 1; i <= size; i++) {
    System.out.print("Enter #" + i + ": ");
    sum += Console.readInt();
}
double average = (double) sum / size;
```

7/10/00

CS 99 • Summer 2000 • Michael Clarkson • Lecture 5

15

for Example #3

- Sum the multiples of 7 between 1 and 1000

```
int sum = 0;
for (int num = 7; num <= 1000; num += 7) {
    sum += num;
}
```

A variable used in a loop to keep a sum of the value of some other variable is called an *accumulator*.

The variable that is declared, checked, and updated is called the *loop index* or *loop control variable*.

7/10/00

CS 99 • Summer 2000 • Michael Clarkson • Lecture 5

16

for Example #4

- Use a for loop to produce the following output:

```
***
***
***
***
```

7/10/00

CS 99 • Summer 2000 • Michael Clarkson • Lecture 5

17

for Example #4 [2]

```
for (int spaces = 3; spaces >= 0; spaces--) {
    for (int i = 1; i <= spaces; i++) {
        System.out.print(" ");
    }
    System.out.println("****");
}
```

7/10/00

CS 99 • Summer 2000 • Michael Clarkson • Lecture 5

18

while Loops

- The while loop is:
 - pretest
 - variable repetition
 - very similar to an if statement

7/10/00

CS 99 • Summer 2000 • Michael Clarkson • Lecture 5

19

First while

```
int num = 1, sum = 0;
while (num <= 100) {
    sum = sum + num;
    num++;
}
```

7/10/00

CS 99 • Summer 2000 • Michael Clarkson • Lecture 5

20

Syntax and Semantics of while

```
while (boolean-expression) {
    ...
}
```

- Evaluate the expression
- If it is true, execute the body of the loop and repeat
- If it is false, transfer control to the next statement after the loop

7/10/00

CS 99 • Summer 2000 • Michael Clarkson • Lecture 5

21

Flow of Control of while

7/10/00

CS 99 • Summer 2000 • Michael Clarkson • Lecture 5

22

Rewriting for as while

```
sum = 0;
for (int i = 1; i <= 100; i++) {
    sum = sum + i;
}

sum = 0;
while (i <= 100) {
    sum = sum + i;
    i++;
}
```

7/10/00

CS 99 • Summer 2000 • Michael Clarkson • Lecture 5

23

while Example #1

- Determine how many powers of two are between 0 and 100 and print each of them

```
count = 0; // counter variable
pow2 = 1;
while (pow2 < 100) {
    System.out.println(pow2);
    pow2 = pow2 * 2;
    count++;
}
System.out.println("There are " + count + " powers of 2 less than 100.");
```

7/10/00

CS 99 • Summer 2000 • Michael Clarkson • Lecture 5

24

while Example #2

- A sentinel is an input value that indicates the end of input
 - e.g., “Enter a number, -999 to quit.”
- Average a set of numbers input from the user, terminated by a sentinel

7/10/00

CS 99 • Summer 2000 • Michael Clarkson • Lecture 5

25

while Example #2 [2]

```
int count = 0;
int sum = 0;
System.out.print("Enter a number, -1 to quit: ");
int num = Console.readInt();
while (num != -1) {
    count++;
    sum += num;
    System.out.print("Enter a number, -1 to quit");
    int num = Console.readInt();
}
if (count > 0) {
    double average = (double) sum / count;
    System.out.println("average = " + average);
}
```

7/10/00

CS 99 • Summer 2000 • Michael Clarkson • Lecture 5

26

while Example #3

- What's wrong with this loop?

```
// print powers of 3 between 1 and 100
pow3 = 1;
while (pow3 != 100) {
    System.out.println(pow3);
    pow3 = pow3 * 3;
}
```

7/10/00

CS 99 • Summer 2000 • Michael Clarkson • Lecture 5

27

while Example #3 [2]

- Infinite loop, should be:

```
// print powers of 3 between 1 and 100
pow3 = 1;
while (pow3 < 100) {
    System.out.println(pow3);
    pow3 = pow3 * 3;
}
```

7/10/00

CS 99 • Summer 2000 • Michael Clarkson • Lecture 5

28

while Example #4

- What's wrong with this loop?

```
// print the first five powers of 3 between
// 1 and x, inclusive
pow3 = 1;
count = 1;
while (count <= 5 && pow3 <= x) {
    System.out.println(pow3);
    pow3 = pow3 * 3;
}
```

7/10/00

CS 99 • Summer 2000 • Michael Clarkson • Lecture 5

29

while Example #4 [2]

- Again, an infinite loop, should be:

```
// print the first five powers of 3 between
// 1 and x, inclusive
pow3 = 1;
count = 1;
while (count <= 5 && pow3 <= x) {
    System.out.println(pow3);
    pow3 = pow3 * 3;
    count++;
}
```

7/10/00

CS 99 • Summer 2000 • Michael Clarkson • Lecture 5

30

do Loops

- **Syntax:**

```
do {  
    ...  
} while (boolean-expression);
```
- **Semantics:**
 - Execute the body
 - Check the condition
 - If true, repeat
 - If false, transfer control to the statement after the loop

7/10/00

CS 99 • Summer 2000 • Michael Clarkson • Lecture 5

31

Flow of control in do

Note that the body of the loop is always executed at least once.

7/10/00

CS 99 • Summer 2000 • Michael Clarkson • Lecture 5

32

do Example #1

- Average a set of numbers input from the user, terminated by a sentinel

```
int count = 0;  
int sum = 0;  
do {  
    System.out.print("Enter a number, -999 to quit: ");  
    int num = Console.readInt();  
    if (num != -999) {  
        count++;  
        sum += num;  
    }  
} while (num != -999);  
if (count > 0) {  
    double average = (double) sum / count;  
    System.out.println("average = " + average);  
}
```

7/10/00

CS 99 • Summer 2000 • Michael Clarkson • Lecture 5

33

do Example #2

- Data validation
- Prompt the user for a yes or no answer, and keep prompting until the user enters either "yes" or "no".

```
String response;  
do {  
    System.out.println("Do you wish to continue? "  
        + "(yes or no): ");  
    response = Console.readString();  
} while ( !( response.equals("yes")  
    || response.equals("no") ) );
```

7/10/00
