Disk Resonator

Electromechanical Model

Stanford 08

Resonant MEMS and models

HiQLab

Anchor losses and disk resonators

Thermoelasti losses and beam resonators

Conclusion

Backup slides

Kirchoff's current law and balance of linear momentum:

$$\frac{d}{dt} (C(u)V) + GV = I_{\text{external}}$$
$$Mu_{tt} + Ku - \nabla_u \left(\frac{1}{2}V^*C(u)V\right) = F_{\text{external}}$$

Linearize about static equilibium (V_0, u_0) :

$$C(u_0) \,\delta V_t + G \,\delta V + (\nabla_u C(u_0) \cdot \delta u_t) \,V_0 = \delta I_{\text{external}} \\ M \,\delta u_{tt} + \tilde{K} \,\delta u + \nabla_u \left(V_0^* C(u_0) \,\delta V \right) = \delta F_{\text{external}}$$

where

$$\tilde{K} = K - \frac{1}{2} \frac{\partial^2}{\partial u^2} \left(V_0^* C(u_0) V_0 \right)$$

▲□▶▲□▶▲□▶▲□▶ □ のQ@

Electromechanical Model

Stanford 08

Resonant MEMS and models Assume time-harmonic steady state, no external forces:

$$\begin{bmatrix} i\omega C + G & i\omega B \\ -B^T & \tilde{K} - \omega^2 M \end{bmatrix} \begin{bmatrix} \delta \hat{V} \\ \delta \hat{u} \end{bmatrix} = \begin{bmatrix} \delta \hat{I}_{\text{external}} \\ 0 \end{bmatrix}$$

Eliminate the mechanical terms:

 $\begin{aligned} Y(\omega) \,\delta \hat{V} &= \delta \hat{I}_{\text{external}} \\ Y(\omega) &= i\omega C + G + i\omega H(\omega) \\ H(\omega) &= B^T (\tilde{K} - \omega^2 M)^{-1} B \end{aligned}$

Backup slides

Goal: Understand electromechanical piece $(i\omega H(\omega))$.

- As a function of geometry and operating point
- Preferably as a simple circuit

Damping and Q

Stanford 08

Resonant MEMS and models

HiQLab

Anchor losses and disk resonators

Thermoelastic losses and beam resonators

Conclusion

Backup slides

Designers want high *quality of resonance* (*Q*)Dimensionless damping in a one-dof system

$$\frac{d^2u}{dt^2} + Q^{-1}\frac{du}{dt} + u = F(t)$$

• For a resonant mode with frequency $\omega \in \mathbb{C}$:

$${m Q} := rac{|\omega|}{2 \, {
m Im}(\omega)} = rac{{
m Stored energy}}{{
m Energy loss per radian}}$$

◆□▶ ◆□▶ ▲□▶ ▲□▶ □ のQ@

To understand *Q*, we need damping models!

The Designer's Dream

Stanford 08

Resonant MEMS and models

HiQLab

Anchor losses and disk resonators

Thermoelasti losses and beam resonators

Conclusion

Backup slides

Ideally, would like

- Simple models for behavioral simulation
- Parameterized for design optimization
- Including all relevant physics
- With reasonably fast and accurate set-up

◆□▶ ◆□▶ ▲□▶ ▲□▶ □ のQ@

We aren't there yet.

Matrices are complex symmetric

Eigenvalues and Model Reduction

Stanford 08

Resonant MEMS and models

HiQLab

Anchor losses and disk resonators

Thermoelasti losses and beam resonators

Conclusion

Backup slides

Want to know about the transfer function $H(\omega)$:

$$H(\omega) = B^{T} (K - \omega^{2} M)^{-1} B$$

Can either

- Locate poles of *H* (eigenvalues of (*K*, *M*))
- Plot *H* in a frequency range (Bode plot)

Usual tactic: subspace projection

• Build an Arnoldi basis V for a Krylov subspace \mathcal{K}_n

• Compute with much smaller V*KV and V*MV

Can we do better?

Variational Principles

Stanford 08

Resonant MEMS and models

HiQLab

- Anchor losses and disk resonators
- Thermoelasti losses and beam resonators
- Conclusion
- Backup slides

Variational form for complex symmetric eigenproblems:
 Hermitian (Rayleigh quotient):

$$\rho(\mathbf{v}) = \frac{\mathbf{v}^* \mathbf{K} \mathbf{v}}{\mathbf{v}^* \mathbf{M} \mathbf{v}}$$

• Complex symmetric (modified Rayleigh quotient):

$$\theta(\mathbf{v}) = \frac{\mathbf{v}^T \mathbf{K} \mathbf{v}}{\mathbf{v}^T \mathbf{M} \mathbf{v}}$$

◆□▶ ◆□▶ ◆□▶ ◆□▶ ● ● ● ●

- First-order accurate eigenvectors ⇒
 Second-order accurate eigenvalues.
 - Key: relation between left and right eigenvectors.

Accurate Model Reduction

Stanford 08

Resonant MEMS and models

HiQLab

```
Anchor losses
and disk
resonators
```

Thermoelastic losses and beam resonators

Conclusion

Backup slides

• Build new projection basis from V:

 $W = \operatorname{orth}[\operatorname{Re}(V), \operatorname{Im}(V)]$

◆□▶ ◆□▶ ▲□▶ ▲□▶ □ のQ@

- span(W) contains both K_n and K
 _n
 ⇒ double digits correct vs. projection with V
- W is a real-valued basis
 - \implies projected system is complex symmetric

Thermoelastic Damping (TED)

▲□▶ ▲□▶ ▲ □▶ ▲ □▶ □ のへで

x 10[.]*

3

Thermoelastic Damping (TED)

Stanford 08

Resonant MEMS and models

HiQLab

Anchor losses and disk resonators

Thermoelastic losses and beam resonators

Conclusion

Backup slides

u is displacement and $T = T_0 + \theta$ is temperature

$$\sigma = C\epsilon - \beta\theta\mathbf{1}$$

$$\rho \ddot{\mathbf{u}} = \nabla \cdot \sigma$$

$$\rho c_{\mathbf{v}} \dot{\theta} = \nabla \cdot (\kappa \nabla \theta) - \beta T_0 \operatorname{tr}(\dot{\epsilon})$$

- Coupling between temperature and volumetric strain:
 - Compression and expansion \implies heating and cooling
 - Heat diffusion \implies mechanical damping
 - Not often an important factor at the macro scale
 - Recognized source of damping in microresonators
- Zener: semi-analytical approximation for TED in beams
- We consider the fully coupled system

Nondimensionalized Equations

Stanford 08

Resonant MEMS and

HiQLab

Anchor losses and disk resonators

Thermoelastic losses and beam resonators

Conclusion

Backup slides

Continuum equations:

$$\sigma = \hat{C}\epsilon - \xi\theta \mathbf{1}$$
$$\ddot{u} = \nabla \cdot \sigma$$
$$\dot{\theta} = \eta \nabla^2 \theta - \operatorname{tr}(\dot{\epsilon})$$

Discrete equations:

$$M_{uu}\ddot{u} + K_{uu}u = \xi K_{u\theta}\theta + f$$
$$C_{\theta\theta}\ddot{\theta} + \eta K_{\theta\theta}\theta = -C_{\theta u}\dot{u}$$

▲□▶ ▲□▶ ▲□▶ ▲□▶ □ のQ@

- Micron-scale poly-Si devices: ξ and η are $\sim 10^{-4}$.
- Linearize about $\xi = 0$

Perturbative Mode Calculation

Stanford 08

Resonant MEMS and models

HiQLab

Anchor losses and disk resonators

Thermoelastic losses and beam resonators

Conclusion

Backup slides

Discretized mode equation:

 $(-\omega^2 M_{uu} + K_{uu})u = \xi K_{u\theta}\theta$ $(i\omega C_{\theta\theta} + \eta K_{\theta\theta})\theta = -i\omega C_{\theta u}u$

First approximation about $\xi = 0$:

$$(-\omega_0^2 M_{uu} + K_{uu})u_0 = 0$$

$$(i\omega_0 C_{\theta\theta} + \eta K_{\theta\theta})\theta_0 = -i\omega_0 C_{\theta u}u_0$$

First-order correction in ξ :

 $-\delta(\omega^2)M_{uu}u_0 + (-\omega_0^2M_{uu} + K_{uu})\delta u = \xi K_{u\theta}\theta_0$ Multiply by u_0^T :

$$\delta(\omega^2) = -\xi \left(\frac{u_0^T K_{u\theta} \theta_0}{u_0^T M_{uu} u_0} \right)$$

Zener's Model

Stanford 08

- Resonant MEMS and models
- HiQLab
