

## Relational Algebra

### Chapter 4

Database Management Systems 3ed, R. Ramakrishnan and J. Gehrke

# Relational Query Languages

- \* <u>Query languages</u>: Allow manipulation and <u>retrieval</u> of <u>data</u> from a database.
- \* Relational model supports simple, powerful QLs:
  - Strong formal foundation based on logic.
  - Allows for much optimization.
- Query Languages != programming languages!
  - QLs not expected to be "Turing complete".
  - QLs not intended to be used for complex calculations.
  - QLs support easy, efficient access to large data sets.

Database Management Systems 3ed, R. Ramakrishnan and J. Gehrke

### 1

## Formal Relational Query Languages

- Two mathematical Query Languages form the basis for "real" languages (e.g. SQL), and for implementation:
  - <u>Relational Algebra</u>: More operational, very useful for representing execution plans.
  - <u>Relational Calculus</u>: Lets users describe what they want, rather than how to compute it. (Nonoperational, <u>declarative</u>.)

Database Management Systems 3ed, R. Ramakrishnan and J. Gehrke

3

### **Preliminaries**

- ❖ A query is applied to *relation instances*, and the result of a query is also a relation instance.
  - Schemas of input relations for a query are fixed (but query will run regardless of instance!)
  - The schema for the result of a given query is also fixed! Determined by definition of query language constructs.
- \* Positional vs. named-field notation:
  - Positional notation easier for formal definitions, named-field notation more readable.
  - Both used in SQL

Database Management Systems 3ed, R. Ramakrishnan and J. Gehrke

## Example Instances

1	sid	<u>bid</u>	<u>day</u>
	22	101	10/10/96
	58	103	11/12/96

- "Sailors" and "Reserves" relations for our examples. S1
- We'll use positional or named field notation, assume that names of fields in query results are 'inherited' from names of fields in query input relations.

1	sid	sname	rating	age	
	22	dustin	7	45.0	
	31	lubber	8	55.5	
	58	rusty	10	35.0	

2	sid	sname	rating	age
	28	yuppy	9	35.0
	31	lubber	8	55.5
	44	guppy	5	35.0
	58	rusty	10	35.0

Database Management Systems 3ed, R. Ramakrishnan and J. Gehrke

## Relational Algebra

- \* Basic operations:
  - <u>Selection</u> ( $\sigma$ ) Selects a subset of rows from relation.
  - <u>Projection</u> ( $\pi$ ) Deletes unwanted columns from relation.
  - *Cross-product* (X) Allows us to combine two relations.
  - <u>Set-difference</u> (— ) Tuples in reln. 1, but not in reln. 2.
  - $\underline{Union}$  (U) Tuples in reln. 1 and in reln. 2.
- \* Additional operations:
  - Intersection, <u>join</u>, division, renaming: Not essential, but (very!) useful.
- Since each operation returns a relation, operations can be composed! (Algebra is "closed".)

## Projection

- Deletes attributes that are not in projection list.
- Schema of result contains exactly the fields in the projection list, with the same names that they had in the (only) input relation.
- Projection operator has to eliminate duplicates! (Why??)
  - Note: real systems typically don't do duplicate elimination unless the user explicitly asks for it. (Why not?)

> age 35.0 55.5

 $\pi_{age}(S2)$ 

Database Management Systems 3ed, R. Ramakrishnan and J. Gehrke

### Selection

- Selects rows that satisfy selection condition.
- No duplicates in result! (Why?)
- Schema of result identical to schema of (only) input relation.
- \* Result relation can be the input for another relational algebra operation! (Operator composition.)

			255
sid	sname	rating	age
28	yuppy	9	35.0
58	rusty	10	35.0

 $\sigma_{rating>8}^{(S2)}$ 

sname rating yuppy 9 rusty 10

 $\pi_{sname,rating}(\sigma_{rating} > 8^{(S2)})$ 

Database Management Systems 3ed, R. Ramakrishnan and J. Gehrke

## Union, Intersection, Set-Difference

- All of these operations take two input relations, which must be <u>union-compatible</u>:
  - Same number of fields.
  - `Corresponding' fields have the same type.
- ❖ What is the *schema* of result?

sid	sname	rating	age
22	dustin	7	45.0

sid	sname	rating	age
22	dustin	7	45.0
31	lubber	8	55.5
58	rusty	10	35.0
44	guppy	5	35.0
28	vuppv	9	35.0

 $S1 \cup S2$ 

sid	sname	rating	age
31	lubber	8	55.5
58	rusty	10	35.0

 $S1 \cap S2$ 

S1-S2

### Cross-Product

- \* Each row of S1 is paired with each row of R1.
- \* Result schema has one field per field of S1 and R1, with field names `inherited' if possible.
  - Conflict: Both S1 and R1 have a field called sid.

(sid)	sname	rating	age	(sid)	bid	day
22	dustin	7	45.0	22	101	10/10/96
22	dustin	7	45.0	58	103	11/12/96
31	lubber	8	55.5	22	101	10/10/96
31	lubber	8	55.5	58	103	11/12/96
58	rusty	10	35.0	22	101	10/10/96
58	rustv	10	35.0	58	103	11/12/96

• Renaming operator:  $\rho$  (C(1 $\rightarrow$  sid1,5 $\rightarrow$  sid2), S1×R1)

Database Management Systems 3ed, R. Ramakrishnan and J. Gehrke

## Joins

\* Condition Join:  $R \bowtie_{c} S = \sigma_{c}(R \times S)$ 

(sid)	sname	rating	age		bid	J
22	dustin	7	45.0	58	103	11/12/96 11/12/96
31	lubber	8	55.5	58	103	11/12/96

$$S1 \bowtie_{S1.sid < R1.sid} R1$$

- \* Result schema same as that of cross-product.
- ❖ Fewer tuples than cross-product, might be able to compute more efficiently
- ❖ Sometimes called a theta-join.
  Database Management Systems 3ed, R. Ramakrishnan and J. Gehrke

## Joins

\* Equi-Join: A special case of condition join where the condition *c* contains only *equalities*.

sid	sname	rating	age	bid	day
22	dustin	7	45.0	101	10/10/96
58	rusty	10	35.0	103	11/12/96

$$S1 \bowtie_{sid} R1$$

- Result schema similar to cross-product, but only one copy of fields for which equality is specified.
- \* Natural Join: Equijoin on all common fields.

### Division

 Not supported as a primitive operator, but useful for expressing queries like:

Find sailors who have reserved <u>all</u> boats.

- $\star$  Let *A* have 2 fields, *x* and *y*; *B* have only field *y*:
  - $A/B = \{ \langle x \rangle | \forall \langle y \rangle \in B \exists \langle x, y \rangle \in A \}$
  - i.e., *A/B* contains all *x* tuples (sailors) such that for *every y* tuple (boat) in *B*, there is an *xy* tuple in *A*.
  - *Or*: If the set of *y* values (boats) associated with an *x* value (sailor) in *A* contains all *y* values in *B*, the *x* value is in *A/B*.
- ❖ In general, x and y can be any lists of fields; y is the list of fields in B, and x∪y is the list of fields of A.

Database Management Systems 3ed, R. Ramakrishnan and J. Gehrke

13

sno s1 s4 A/B2 sno s1 A/B3

atabase Management Systems 3ed, R. Ramakrishnan and J. Gehrke

## Expressing A/B Using Basic Operators

- \* Division is not essential op; just a useful shorthand.
  - (Also true of joins, but joins are so common that systems implement joins specially.)
- **❖** *Idea*: For *A/B*, compute all *x* values that are not `disqualified' by some *y* value in *B*.
  - *x* value is *disqualified* if by attaching *y* value from *B*, we obtain an *xy* tuple that is not in *A*.

Disqualified *x* values:  $\pi_{\chi}((\pi_{\chi}(A) \times B) - A)$ 

A/B:  $\pi_{\chi}(A)$  – all disqualified tuples

Database Management Systems 3ed, R. Ramakrishnan and J. Gehrke

15

### Find names of sailors who've reserved boat #103

\* Solution 1: 
$$\pi_{sname}((\sigma_{bid=103} \text{Reserves}) \bowtie Sailors)$$

\* Solution 2: 
$$\rho$$
 (*Templ*,  $\sigma_{bid=103}$  Reserves)

$$\rho$$
 (Temp2, Temp1  $\bowtie$  Sailors)

$$\pi_{sname}\left(Temp2\right)$$

\* Solution 3: 
$$\pi_{sname}(\sigma_{bid=103}(\text{Re}\,\text{serves}\bowtie Sailors))$$

Database Management Systems 3ed, R. Ramakrishnan and J. Gehrke

### Find names of sailors who've reserved a red boat

 Information about boat color only available in Boats; so need an extra join:

$$\pi_{\mathit{sname}}((\sigma_{\mathit{color} = '\mathit{red}'}, \mathit{Boats}) \bowtie \mathsf{Reserves} \bowtie \mathit{Sailors})$$

\* A more efficient solution:

$$\pi_{\mathit{sname}}(\pi_{\mathit{sid}}((\pi_{\mathit{bid}}\sigma_{\mathit{color} = '\mathit{red}'}\mathit{Boats}) \bowtie \mathsf{Res}) \bowtie \mathit{Sailors})$$

A query optimizer can find this, given the first solution!

Database Management Systems 3ed, R. Ramakrishnan and J. Gehrke

### Find sailors who've reserved a red or a green boar

 Can identify all red or green boats, then find sailors who've reserved one of these boats:

$$\rho~(Tempboats, (\sigma_{color = 'red' \lor color = 'green'}~Boats))$$

 $\pi_{sname}$  (Tempboats  $\bowtie$  Reserves  $\bowtie$  Sailors)

- Can also define Tempboats using union! (How?)
- \* What happens if  $\vee$  is replaced by  $\wedge$  in this query?

Find sailors who've reserved a red and a green book

Previous approach won't work! Must identify sailors who've reserved red boats, sailors who've reserved green boats, then find the intersection (note that sid is a key for Sailors):

$$\rho \; (Tempred, \, \pi_{sid}((\sigma_{color = 'red'} \textit{Boats}) \bowtie \mathsf{Re} \, serves))$$

$$\rho$$
 (Tempgreen,  $\pi_{sid}$ (( $\sigma_{color='green'}$ , Boats) $\bowtie$  Reserves))

$$\pi_{\mathit{sname}}((\mathit{Tempred} \cap \mathit{Tempgreen}) \bowtie \mathit{Sailors})$$

Database Management Systems 3ed, R. Ramakrishnan and J. Gehrke

Find the names of sailors who've reserved all boats

Uses division; schemas of the input relations to / must be carefully chosen:

$$\rho~(\textit{Tempsids}, (\pi_{\textit{sid,bid}} \texttt{Reserves}) \, / \, (\pi_{\textit{bid}} \textit{Boats}))$$

$$\pi_{sname}$$
 (Tempsids  $\bowtie$  Sailors)

\* To find sailors who've reserved all 'Interlake' boats:

..... 
$$/\pi_{bid}(\sigma_{bname=Interlake'}Boats)$$

Database Management Systems 3ed, R. Ramakrishnan and J. Gehrke

TO THE

## Summary

- The relational model has rigorously defined query languages that are simple and powerful.
- Relational algebra is more operational; useful as internal representation for query evaluation plans.
- Several ways of expressing a given query; a query optimizer should choose the most efficient version.

Database Management Systems 3ed, R. Ramakrishnan and J. Gehrke
